Toronto, Ont., Oct. 28, 1913.—The local market for structural steel is reported to have been considerably disturbed this week owing to the action of certain structural shops in disposing of surplus stocks at lower than the market price, their object being to get back the money paid for this commodity, and to reduce stock. Local dealers have been cutting prices on structural steel five cents a pound for desirable business. Steel bars are selling at 2.25 and small shapes at 2.35, f.o.b., Toronto warehouse. For small orders 2.30 and 2.40 are being charged. New specifications have begun to appear, mainly from contractors whose money for contracts is coming in, and from others on whom the bank has taken pity and allowed them money to go ahead with their jobs. The implement people are also buying steel for Western goods. Farming machinery is being manufactured and shipped to Western representatives with the understanding that no interest shall accrue on machinery sold until November, 1914. Thus the implement men have absolute faith that the season will be good for Western business, but at the same time are sure that they will get no money until after next summer. Steel bars in Pittsburgh are 5 cents higher than structural steel and plate, which is unprecedented. As a rule it is the other way around. The demand for sheets is not heavy, but is improving, principally from the stove people. Several engineering shops in the city have secured good contracts, and have placed orders for steel. On the whole, however, dealers are looking forward to the quietest season for five or six years. The Eagle and Globe Steel Co., a Sheffield firm, with offices on Front Street, have not suffered much from depression, but are not rushing. Manufacturers of wrought iron pipe have revised their prices, the discounts on smaller sizes being increased considerably. A full list of changes will be found among the selected market quotations. Wrought iron pipe makers have found business slack for the past two or three months, but are busier now, Western dealers having ordered supplies to be rushed through before navigation closes.

Metals.

Copper is down in New York, and English prices are up for spot delivery, but futures are down. Visible supplies are a little greater. Prices in Toronto remained the same. Spelter is down, also tin to $41.50 from $43.00. The metal business is very poor.

* * *

MACHINERY HALL, CANADIAN NATIONAL EXHIBITION.

THE Bawden Machine Co., general engineers and pumping machinery manufacturers, Stirling Road, Toronto, give expression to their views, regarding the proposal for a new machinery hall at the Canadian National Exhibition, Toronto, in the following letter:

Your letter of September 12, re above, received and we are glad to know that some person is taking the initiative in this matter. We were very anxious to make a large exhibit at the Canadian National Exhibition this year, having just put a new pump on the market different from any ever made in this country. The engineers and those interested in steam pumps were very anxious to see it in operation, and we advised them we would have them running at the Exhibition, but when we had our space allotted, we found all we could get was about 16 feet, in a corner, and as this would not accommodate more than one pump with room to get around it, we had to abandon the idea of exhibiting altogether after going to a good deal of trouble to get the pumps ready in time. We think that if a new machinery hall is put up, there should be means of getting steam for steam operated apparatus, as engineers are anxious to see anything new in operation, and the Exhibition authorities are a long way out in their ideas to think that hydro-electric has displaced steam altogether.

We trust your efforts will bear fruit, and that by next year there will be a Machinery Hall at the Canadian National Exhibition where the Canadian manufacturers can have a chance to make a decent exhibit.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Rideau Junction, Ont.—A start has been made on the C.N.R. shops here.

Montreal, Que.—Metals, Ltd., 30 St. James St., contemplate the erection of a factory.

Fort William, Ont.—The Great West Fence Co., of Winnipeg, will erect a plant here.

Toronto, Ont.—The foundry of R. Bigley Co., Ltd., Macdonell Ave., was damaged recently by fire.

Montreal, Que.—The Steel Co. of Canada recently awarded contracts for its new nail factory here.

Toronto, Ont.— The Consumers' Gas Co. are making plans for further enlargement of their works.

Port Mann, B.C.—Work on the foundations of the C.N.R. roundhouse and car repair shops has begun.

Portage la Prairie, Sask.—A Port Huron firm of machinery manufacturers have secured a site for a plant.

Sydney Mines, N.S.—The Nova Scotia Steel & Coal Co. will instal a new coal washing plant at a cost of $35,000.

Lindsay, Ont.—The Lindsay Machine Works will build an addition to their machine shop and garage on William St.

Exeter, Ont.—The ratepayers have voted almost unanimously in favor of a loan of $10,000 to the Exeter Manufacturing Co., a new foundry concern.

Calgary, Alta.—The Lewis File & Rasp Co., Massillon, Ohio, plan to erect a branch factory at Calgary. Work on the building will commence early.

East Toronto, Ont.—The Toronto Railway Co. will erect an addition to their car barns on the Kingston Road section of the York Radial.

St. Marys, Ont.—C. Richardson & Co., makers of dairy machinery, are making an addition to their factory, four storeys high, 40 x 70 feet. Plans have been prepared.

Welland, Ont.—The Dominion Dredging Co. have begun the erection of a machine shop, round house, etc., preliminary to starting work on a big scale on the Welland canal.

Rimouski, Que.—Edward Curotte has opened a machine shop here to do repair work on steamers, gasoline yachts, saw mill and general mechanical engineering.

Port Arthur, Ont.—It is understood that one object of the visit to London of Sir Wm. Mackenzie and Mr. J. J. Carrick, M.P., is to raise ten million dollars for steel works at Port Arthur.

Stratford, Ont.—The Canadian General Electric Co. will spend $25,000 on an addition to the plant of the Stratford Mill Bldg. Co. recently purchased by the above firm. J. L. Youngs, Stratford, contractors.

Hamilton, Ont.—John G. Gauld, K.C., announces that all contracts for the erection of the plant of the Hamilton Gas, Coke & By-Product Co. have been let, and that the plant will be completed by the first of October next.

Quick Removable Bar Cylinder Co., Ltd., incorporated at Ottawa, capital $500,000, to purchase and take over that certain invention known as a Detachable Bar Threshing Cylinder, invented by W. E. Leavell, at Redcliff, Alta.; Incorporators: William De Hale, John M. Tinnall, etc., Medicine Hat, Alta.

Uxbridge, Ont.—The Uxbridge Foundry Co., Ltd., has been incorporated at Toronto, capital $40,000, to carry in a general foundry, contracting, carpentry, joinery and decorating business, at Toronto. Provisional directors: William S. Thomas, William J. Mitchell, Robert J. Christie, George H. Constant, and William W. Cole, Toronto.

Medicine Hat, Alta.—Several carloads of steel have arrived at Medicine Hat for the building of the Saskatoon Bridge & Iron Co., Ltd., plant. As yet the railway spur to the site has not been completed, but in the meantime the steel is being hauled there so that the framework of the new structures can be proceeded with before the cold weather sets in.

Mesta Machine Co.—The report that the Mesta Machine Co., Pittsburgh, will build a plant in Canada is incorrect. It has simply arranged with a company at Bridgeburg, Ont., to manufacture for it some machinery on which the Mesta Machine Co. owns Canadian patents, and which the Canadian patent laws require to be manufactured in Canada.

Electrical

Lacombe, Alta. — The municipality will instal a twenty-five light electric system.

Woodville, Ont.—The sum of $4,000 will be expended on an electric distributing plant.

Westmount, P.Q.—The Corporation of Westmount have appropriated $25,000 for street lighting for the coming year.

Strathroy, Ont.—The Hydro-Electric Commission will supply Strathroy with 200 h.p. at $44 per h.p. for a 24-hour service.

London, Ont. The London Street Railway Co. will take power from the city, a satisfactory price having been agreed upon.

Winnipeg, Man.—The city will ask the ratepayers for $1,000,000 to be spent on a power plant, and $85,000 for an incinerator.

Smithers, B.C.—J. L. Hamilton and J. Fraser have selected a site on which they will erect an electric light plant and waterworks.

Smithville, Ont.—H. Gracey, furniture dealer, will purchase gasoline engine storage batteries and generator for 1,000 c.p. electric light.

Edmonton, Alta.—Plans and specifications will be prepared for an extension to the civic power plant, and tenders called for at an early date.

Outlook, Man.—The town has passed the following:—$10,000, municipal rink; $10,500 for electric light extension; and $3,500 for waterworks extension.

Toronto, Ont.—The City Hydro-Electric Commission will issue from $1,000,000 to $2,000,000 additional bonds to extend the system.

Windsor, Ont.—The city council has taken up the question of buying the street railway to ensure the success of the Hydro-Electric plant from the start, by stopping competition.

St. Hyacinthe, Que.—The town council have granted the electric lighting and power privilege to Clarence McCuaig & Co., of Montreal. This is a thirty-year franchise.

Windsor, Ont.—J. M. Goodall, who is in charge of construction work on the

What I Have Noticed

Told by an Editor

¶ Enter the office of any machine shop or engineering shop in Canada, and what is the first thing you see? Think now. Probably you are introducing yourself to the general manager, but what is it that catches your eye first? It is the white cover of "Canadian Machinery"—and it lies there at the general manager's right hand.

¶ I will go further. Have you ever noticed, while in the general office, that the superintendent of the works has entered, and after rummaging among the trade papers on the manager's desk, has asked for "Last week's Canadian Machinery?" I have. I have seen him turn to the page on "Machine Shop Methods and Devices," and after reading for a while, take the paper to the works, there to put some method into practice.

¶ That is not all. On occasions I have slipped into offices unexpectedly, and have taken a seat while the manager dictated a letter. And what was he doing, think you? On his knee was a copy of "Canadian Machinery" from which he was dictating an order for new equipment. There was nothing unusual in it. After the stenographer had got it all down, he turned to me to do business. I have seen this in both foundries and machine shops.

¶ Ask yourself this question, when in your morning mail you receive an inquiry for equipment from a firm you did not know existed: "However did they hear of us?" Then think of the hundreds of machine shops in which your goods are shown between those two white covers of "Canadian Machinery."

¶ There is this about it. I have observed that when a man wants a machine, a gear, a drill, a pulley, or a crane, he invariably picks up "Canadian Machinery" for guidance, for no man keeps a complete buyer's directory in his mind. And I have noticed that between those two covers he invariably finds what he needs.

Rate card and full particulars on request.

Canadian Machinery & Manufacturing News

Canada's only Machinery and Metal Working Paper.
A weekly publication that thoroughly covers its Field.
143 University Avenue, TORONTO

transmission line from St. Thomas to Windsor, says power should be turned on by next winter.

Swift Current, Sask.— The Gillstrom Contracting Co. have been awarded a contract by the city to build a power house. Geo. D. Mackie, engineer.

North Battleford, Sask.—The city will investigate the posibilities of developing power three miles west of the city on the North Saskatchewan river. It is believed 40,000 h.p. can be generated.

Kingston, Ont. — The Corporation have decided to construct a system of underground conduits upon four of the principal streets, abolishing the unsightly poles.

Toronto, Ont.— The Canadian Stewart Co. who have the $10,000,000 contract for dredging the harbor will use electricity to operate their machinery where possible and if not too costly.

Owen Sound, Ont.—The Hydro-Electric plans for a plant at Eugenia Falls have been approved by the Electric Light and Power Committee of the town council, and a by-law will be drafted.

Brantford, Ont.—A plan to develop 2,500 horse-power at Mohawk Lake to take care of its peak load in Brantford is under consideration by the Dominion Power & Transmission Co.

Morrisburg, Ont.—The Hydro-Electric Power Commission is generating power from a power house owned by the municipality. Prescott, Morrisburg, Winchester and Chesterville will be supplied.

Weston, Ont.—Weston Electric Light Commission have decided to sell electric supplies to the residents of the municipality. Dr. E. F. Irwin and Secretary A. Pearson have been appointed to make the purchases.

Sherbrooke, Que. — The Sherbrooke Railway & Power Co. have purchased from C. E. Kennedy, of Coaticook, the electric lighting franchise of Ayer's Cliff, Que. This includes light and power and the franchises for street lighting for a term of years.

Chatham, Ont.—The Hydro Commission will be asked to assist the city council in valuing the electric department of the Chatham Gas Company, with a view to the city purchasing it for use in distributing power to Chatham consumers.

Souris, Man. — The town has just closed a contract for a large $4,000 electric light plant. The contract has been awarded to the Accumulator Lighting Co., Winnipeg, who will instal one of its storage battery systems. The town will be lighted with ornamental five light clusters.

London, Ont.— The ratepayers have voted in favor of electrifying the London and Port Stanley Ry., a municipally owned line, at a cost of $700,000. A commission of five will be named to manage the work, and the following will probably be appointed: Mayor Graham, Hon. Adam Beck, Philip Pocock, Lt.-Col. W. M. Gartshore, and M. O. Fraser, K.C.

Hamilton, Ont.—The Dominion Power and Transmission Co. have completed plans for an auxiliary steam power plant at the foot of James street, to develop 27,000 h.p., costing $1,250,000. W. C. Hawkins, managing director, is authority for this statement. Provision will be made for the addition of units reaching a maximum of 90,000 horsepower in later years, which will entail an outlay of $3,500,000.

General Industrial

Toronto, Ont.—Gunns, Ltd., Toronto, plan to erect a fertilizer factory to cost about $25,000.

Montreal, Que.—The Laurentide Co., Grand Mere, Que., are planning the installation of additional paper machines.

Blairmore, Alta. — The Keystone Cement Co. with a plant worth $600,000 has begun operations. Another $100,000 will be spent.

Bridgeburg, Ont.— Mentholatum Co. are building a factory costing $20,000. Turner Construction Co., Buffalo, contractors.

Glace Bay, N.S.— A hospital to cost $60,000 is planned by the General Hospital Board. Architect, Geo. Beckwith, Sydney, N.S.

Winnipeg, Man.—The J. R. Watkins Medical Co. will build a factory and warehouse here. Paul Watkins is president and the head office is at Wyoming, Minn.

Coquitlam, B.C.—The Port Haney Brick Co. recently installed a 150 h.p. boiler costing $2,500, and a new dry pan. Other improvements are under way. Prospects are reported to be good.

Sherbrooke, Que.—The Elbram Stone Co., makers of artificial marble, floor tiles, and various cement products, with a capital of $100,000, have applied to the city for a site, exemption, and power at minimum rates. They will erect a brick plant 150 x 50 feet, and instal machinery costing $10,000.

Toronto, Ont.—The Dominion District Steam Heating plant have asked the Board of Control for power to lay pipes in the streets, and co-operate with the Hydro-Electric. The company is a subsidiary of the American District Steam Heating Co., of Lockport, N.Y., and has a capital of $100,000, which may be increased to $2,000,000 if permission is given. J. R. L. Starr, Toronto, is the firm's solicitor.

Wood-Working

Madoc, Ont.—This town is to have a new planing mill and builders' supplies factory.

Lake Megantic, Que.— The building of the broom factory by P. Cliche is progressing rapidly.

Scotstown, Que.—The new chair factory has started operation. Several machines are now running.

Sarnia, Ont.— Sommers Bros., Saginaw, Mich., plan to erect a match factory here, to cost about $30,000.

Souris, Man.—The Arnett Furniture Co., Ltd., will increase the capacity of their plant. The necessary capital is being raised, and work will start next spring.

Trade Gossip

O'Brien, Doughny, Quinlan & Robertson, contractors for section No. 3, the principal section on the new Welland Ship Canal, are opening offices on Chappel Street, Welland.

Transcona, Man.—The city council is objecting to a 13,000 volt. transmission line for the N.T.R. shops being strung through the streets on the ground that it is dangerous.

W. H. Bytham has resigned his position as manager of the Montreal branch of the Canadian Union Electric Co. to take up a directorship in the Electrical Repair & Contracting Co. in Montreal.

Canada May Suffer.—According to a London cable, Canada's situation under the new U.S. tariff is the subject of much comment there, and West Indies merchants admit that the provision of an alternative market will undoubtedly have effect in diverting to the United States a great deal of trade otherwise transacted with Canada under the new reciprocity agreement.

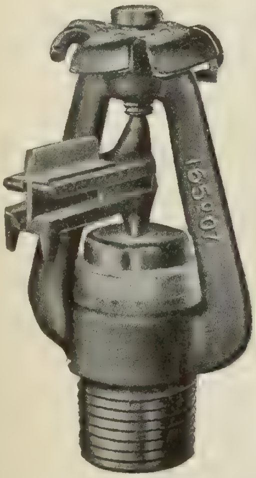
Brass Flange Standard.— An American standard for dimensions for brass flanges was adopted on September 17 by the Committee of Manufacturers on Standardization of Fittings and Valves,

This is the Way

Many Manufacturers are Saving Money

Scores of the leading manufacturers have seen the wisdom of equipping their plants with

Manufacturers' Automatic Sprinklers



Because, besides providing absolute protection from fire, their installation cuts insurance premiums from 30 to 80%. The cut in insurance will pay for installing in from three to five years.

Protect your factory and save money by installing Manufacturers' Automatic Sprinklers.

A Business Man in Action

The business of the world is conducted by individual men. The motive power that accumulates fortunes, stimulates enterprise and keeps the industrial machine well oiled for the grinding out of food supplies to the peoples of the earth, is assuredly in common parlance—brains. But brains differ in timbre. That is why a celebrated thinker said that the

Best Study of Mankind Was Man

In the current issue of MacLean's Magazine, the story of the Bordens—big men of both political parties in Canada, gives us studies of popular, successful and very human fellowmen These character and family sketches are contributing mightily towards the interests of the readers. In the December number look out for the racy account of the Fighting Denisons of Toronto, a family who would not settle in the Queen City when it was proposed that

Toronto Be Called Dublin

The Germans who have aided the Kaiser in making modern Germany what a magnificent machine it is, are well described by Frederic W. Wile, Berlin correspondent of the London Daily Mail. MacLean's has the copyright. Ballin, just out, is timely. He is even now trying to make the German Empire a partner in the Hamburg-American Steamship Line. Bebel, the Red Napoleon, will be described in December.

In Fiction, the best stories are appearing. A short story by Cody relates how a

Lawyer is Beaten by a Boy

In our new serial, Spanish Gold, by George A. Birmingham, there appears a humorous story that will set everyone agog.

If this is not enough, take a look in December at:—

—The New Scrooge.
—Millions From Waste.
—Moving a University.
—A 1,000 Miles of Wealth.
—The Banking Situation.
—The Popular Book.
—Power That Serves.

And the unexcelled Review of Reviews Department in Canada's premier magazine.

SECURE A COPY OF THIS MAGAZINE FROM YOUR STATIONER TO-DAY. 20 CENTS A COPY. —TWO DOLLARS A YEAR.

effective January 1, 1914, and a copy of the pamphlet giving the tables of the dimensions can be obtained by addressing W. H. Douglas, secretary of the committee, 30 Church street, New York City.

Oxy-Acetylene Installation Saving.—Acccording to an American contemporary, a small oxy-acetylene installation recently saved the Crocker Chair Co. $5,000. The largest planing machine in the chair shops was broken, and the managers placed the purchase of a new machine at $2,500, and the loss of about the same value in time and production until a new machine could be installed. The welding plant was then resorted to, and in less than two hours the machine was repaired and again in operation.

The British Manufacturers' Association, Ltd., whose head offices are in London, England, have established a Canadian branch at 803 McGill Building, Montreal. This office is in charge of Mr. R. J. McLean. The firm have branches in the Argentine, Brazil, Egypt, Sweden and elsewhere. They act as manufacturers' agents for a number of well-known British firms, and handle steam engines, steam and water turbines, machine tools, and also all classes of high grade steel, including forgings and tool steels.

Personal

G. Janin, chief engineer of Montreal, has just returned from a visit to Europe.

J. L. Lang, B.A.Sc., has accepted a position in Galt as assistant to the city engineer.

F. J. Bell, general manager of the Canada Wire and Cable Co. is on the Continent.

Geo. Cavehill, of Caverhill, Learmont & Co., Montreal, celebrated his fifty-fifth birthday recently.

Andrew Jardine, salesman for the A. B. Jardine & Co., Hespeler, Ont., is out West on a business trip.

Dr. Imhoff, inventor of the Imhoff tank system of sewage disposal, is coming to Canada.

L. W. Smith, of the Canadian Tap & Die Co., Galt, has gone on an extensive business trip through Western Canada.

Bernice Smith, the first woman student in civil engineering in Canada, has been enrolled by Manitoba University.

James Ross, late president of the Dominion Coal Co. left an estate of $15,000,000, half of which was in C. P. R. stock.

John Carroll, 219 Garry street, Winnipeg, has been appointed to succeed the late Dan Smith as Provincial Factory Inspector.

E. W. Gilman, general manager of the Canadian Rand Co., Sherbrooke, Que., left last week for his annual trip to the Pacific Coast, and will visit the various branches of the company before returning to the East.

Frederick G. Clapp, the gas expert appointed by the city of Edmonton to go into the gas possibilities of the Province and report to the council, has asked for a settlement of his bill amounting to $4,000.

Rt. Hon. R. L. Borden, the Prime Minister, laid the corner stone of the new Transcontinental Railway workshops, at St. Malo, Que., on Oct. 23, and later laid the corner-stone of the River St. Charles locks.

William McMaster, vice-president of the Dominion Steel Corporation, and for many years head of the Montreal Rolling Mills, has been elected a member of the Board of Directors of the Bank of Montreal in place of the late James Ross.

Manager Glassco, of the Winnipeg light and power department returned Saturday, Oct. 18, from Montreal where he has been consulting with engineers and corporations regarding the new transmission line to the city power plant at Point du Bois. He was dealing particularly with the question of flexible towers and the extension to the plant.

Edmund Bristol, M.P., of Toronto, who returned Oct. 23, from a trip to London in connection with the financing arrangements of the Canada Steamship Lines, stated that negotiations were proceeding smoothly, but no definite announcement could be made as to when the new issues would come on the market.

Tenders

Montreal, Que.—The Montreal Light, Heat and Power Company are calling tenders for extensions to their gas works at Cote St. Paul, Que.

Winnipeg, Man. — Tenders addressed to the Chairman, Board of Control will be received up to November 4th, for the manufacture and delivery at the power house at Point Du Bois of electrically operated switching gear and accessories.

Winnipeg, Man.—Tenders addressed to the chairman, Board of Control, will be received up to Saturday, November 15th, for the supply and installation of five complete pumping units, together with step down transformers, switch board and accessories.

Toronto, Ont.—Tenders will be received by the chairman of the Board of Control, Toronto, up to November 18th, for:—Brass and bronze castings, brass work for house services, cast iron pipes, hydrants, iron valve and stop cock boxes, lead pipe, special castings, stop valves.

Specifications and tender form for any of the foregoing may be obtained upon application at the head office of the Department of Works, City Hall, Toronto. H. C. Hocken (Mayor), chairman Board of Control.

Contracts Awarded

Westboro, Ont.—The ratepayers have awarded a 10-year contract for lighting the streets to the Ottawa Electric Co.

Winnipeg, Man.— The John Dolman Co., Winnipeg, has been awarded a contract for installing boilers in the new civic power plant at $5,700.

Montreal, Que. — Robert Neville is general contractor for the new plant of the G. R. Prowse Range Co. The Dominion Bridge Co. have the contract for steel.

Montreal, Que.—The John S. Metcalf Co., Ltd., has been awarded a contract by the C.P.R., for the extension of the Glen Arch at Westmount, Que., at $50,000. The extension will provide for four tracks.

Montreal, Que.—A contract for a 450 h.p., 250 r.p.m., 550 volt, 25 cycle, slip ring type induction motor, together with a Siemens type liquid starter, has been placed with the Siemens Company of Canada, Ltd., by the Dome Mines Co. of South Porcupine. The motor is to be used to drive a compressor made by Belliss and Morcom.

Ottawa, Ont.— The contract for section 2 of the new Welland Ship Canal was let on Oct. 21, to the firm of Baldry, Yerburgh and Hutchinson, of London, England, and St. Catharines, the lowest tenderers. The contract price is slightly under $5,500,000. There are now under contract three sections of the new canal, and there remain six sections for which tenders will be called.

Ottawa, Ont.—The contract has been let for the construction of a government experimental cold-storage plant at

Grimsby, Ont. The plant will cost $25,000, and will have a capacity of 50,000 cubic feet. It will be ready for operation by next fruit season. J. A. Ruddick, chief dairy and cold-storage commissioner, Ottawa.

Vancouver, B.C.—The York Manufacturing Co., makers of ice-making and refrigerating machinery, York, Pa., have made an installation for the Mainland Ice & Cold Storage Co., Ltd., Vancouver, B.C., consisting of one 90-ton vertical single-acting chain-driven refrigerating machine with high pressure side complete, using flooded ammonia condensers; also one 50-ton flooded freezing system complete.

Montreal, Que.—The controllers recently awarded Picard, Valin & Co., the contract for the construction of a combined fire and police station in Bordeaux ward, at a cost of $90,000. Tenders for the construction of a fire station at the corner of Young and Ottawa streets were opened by the Board and referred to the chief engineer. The tenderers were C. E. Deakin, $57,900; J. Denis, $80,000; J. G. Gratton, $71,562, and Thos. Lessard, $81,200. Tenders for the erection of the St. Louis public baths were also referred to the engineers. They were from L. Langevin, $35,000; J. Denis, $42,000, and O. Chauvin, $44,980.

Municipal

Delhi, Ont. — The town council will spend $32,000 on a waterworks system. Roger Crysler, clerk.

Castor, Alta.—The ratepayers will be asked to provide $20,000 for drilling for gas and the erection of a plant.

Sarnia, Ont.—The assessment of the Perfection Stove Co. has been fixed at $25,000. A by-law to extend water mains and sewers has been carried.

Vancouver, B.C.—The city will seek a charter amendment to allow it to operate or grant franchises for motor buses in the city.

Windsor, Ont. — The Essex County Council will let the people vote on a scheme to spend $1,000,000 on good roads.

London, Ont. — Two boilers costing about $7,000 are needed to heat Victoria Hospital. Mayor C. M. R. Graham, Engineer, H. P. Elliott.

Winnipeg, Man.—The council of Kildonan, a suburb of Winnipeg, is considering the question of installing waterworks and sewerage system.

Winnipeg, Man.—The Bank of Montreal is prepared to finance the entire $13,500.000 loan that will be required

for the carrying out of the Shoal Lake water project.

London, Ont.— Contracts for storm sewer construction will be large ones so as to rush the work. A big trunk line and the disposal plant on Egerton St., will go down this winter.

Ottawa, Ont.—The Waterworks Committee will purchase 180 fire hydrants next year, costing $20,000. City Engineer Currie will spend $5,000 now on hydrants.

Edmonton, Alta.—The Pelican Oil & Gas Co. were the only tenderers to the city for a supply of gas, their price being 15 cents per 1,000 cu. ft., the city to put in its own distribution system. The municipality may build its own plant.

Building Notes

Toronto, Ont.—Tenders for the new Customs House will be called within a month.

Quebec, Que.—The C.P.R. will erect a large modern passenger station here. The new structure will be commenced in the spring.

Medicine Hat, Alta. — The plans for the new brewery building, which is being built by the Medicine Hat Brewing Co., have been approved by the council.

Victoria, B.C.—Tenders will be called in two months for a new hospital to cost $399,840. Loring P. Rixford, San Francisco, architect.

Hamilton, Ont.—A Toronto syndicate has purchased the property at James and Mulberry streets for $100,000. It is said a hotel will be erected on the site.

Athabasca, Alta. — Revillon Freres Trading Co. will build a two-storey block, equipped with elevators and heating system. J. E. Brown, Edmonton, is their representative.

Toronto, Ont. — Ernest McConkey, King St. W., will erect a hotel on Bay St. similar to his present building on King St., with high-class restaurant and sleeping accommodation.

Welland, Ont.—Robert E. Hysert, contractor, is building 46 residences for the employes of the Empire Cotton Mills. The Union Carbide Company, Welland, will erect or give some builder a chance to erect, 150 residences suitable for its workmen.

Toronto, Ont.—Acting City Architect Price has issued building permits to Britnell, Limited, for the erection of a stable and garage in the rear of Aylmer avenue near Yonge, to cost $8,000, and to F. R. Cowan for the erection of a two-storey warehouse on the west side of Pape, to cost $32,000.

Catalogues

The Canadian Westinghouse, Ltd., Hamilton, Ont., have issued circular No. 1205, which deals with carbon circuit-breakers. The various types which they make are fully described and illustrated, their chief features being carefully explained. Copies of this circular will be mailed on request.

The "Losles" Automatic Electric Water Heater is the subject of a pamphlet which we have received. The claims for its consideration are clearly set forth and comparison made with similar apparatus using gas for heating. Copies of this pamphlet may be obtained from Geo. Wilkinson, Harrogate, Eng.

The Whiting Foundry Equipment Co., Harvey, Ill., have sent us a copy of bulletin No. 104, which deals with the "Walters" quick-detachable grab bucket. The construction of the bucket and principles involved in its design are explained clearly and illustrations given of some recent installations. An interesting feature is the quick-detachable gear fitted to these buckets.

The Bureau of Mines Branch of the Department of the Interior of the United States Government, Washington, D.C., have recently issued bulletin No. 22, entitled "Analyses of Coals." The bulletin is published in two parts, part 1 being devoted to analyses, and part 2 to descriptions of samples. A great deal of valuable information is given relative to coal and coal mining in the United States.

The Whiting Converter is fully described in bulletin No. 106, which has recently been published by the Whiting Foundry Equipment Co., Harvey, Ill. The process for making steel for castings in this converter is explained and illustrations of recent installations shown. The feasibility of installing these converters in grey iron foundries for small production of steel castings is explained. Copies of this bulletin may be had on request.

Corrugated Copper Expansion Joints.—In the catalogue describing corrugated copper expansion joints, just issued by E. B. Badger & Sons Co., Boston, Mass., we find two tables which contain data of value to every consulting and designing

UNDER THE WINDING-UP ACT.
IN RE THE STAR IRON COMPANY LIMITED,
In liquidation.

Foundry of 30 tons daily capacity.

For sale at auction.

The undersigned will sell at their rooms, 69 St. James Street, Montreal, on Thursday,

November 13, at 11 a. m.

the assets of the above estate as follows:—

Grounds, buildings, machinery, patterns, moulds and plant with rights in water power and leases, situated at Beauharnois, P. Q.

The patterns and moulds comprise, viz:—

A. Patterns and moulds for the celebrated "New Star Boiler" from No. 0 to No. 10, and all connections.

B. Patterns and moulds for the "Canada Improved" Radiators, 20 to 45 inches, plain and ornamented.

C. Patterns and moulds for Soil Pipe and soil pipe fittings in sizes 2-in., 3-in., 4-in. and 6-in. in light, medium and extra heavy.

D. Patterns and brass moulds for full assortment of the "Star" steam fittings.

The whole of the above to be sold en bloc, the purchaser to buy at cost price all material and goods manufactured, both at Beauharnois and at the warehouse, 1356 Cadieux Street, Montreal, consisting principally of "Star" Hot Water Boilers, parts and repairs.

Of the Star Boilers there are in actual operation 15,000. This should justify good and profitable results in the sale of parts and repairs.

All information can be had, and the factory can be seen in operation by addressing the Liquidator.

Marcotte & Freres Auctioneers
Alexandre Desmarteau Liquidator
60 Notre Dame St., E., Montreal.

METAL STAMPINGS

We are manufacturers of stamped parts for other manufacturers. We do any kind of sheet metal stamping that you require. Our improved presses and plating plant enable us to produce the finest quality of work in a surprisingly short time.

We can finish steel stampings in Nickel, Brass or Copper.

engineer, and to operating engineers who may have occasion to make changes in their steam lines. These tables give the lengths of pipe cared for by Badger expansion joints. The above Company will be glad to send a copy of the catalogue to anyone asking for it.

Bulletin No. 73, issued by the Shaw Electric Crane Co., deals with their overhead mono-rail track system of transporting materials in yards, factories, etc. The reading matter and illustrations explain clearly the various conditions under which this system can be operated. Not the least interesting feature is the F. T. (fixed tongue) track switch which is used in connection with this system. Copies of this bulletin may be obtained from the sales agents, Manning, Maxwell & Moore, Inc., New York City, N.Y.

The Dominion Steel Foundry Co., Ltd., Hamilton, Ont., have sent us a very attractive pamphlet, entitled "Dominion Cast Steel Parts," which deals with the products which they manufacture. A description is given of the plant, with clear cut views of the the exterior and interior, showing the furnaces and ovens, etc. The pamphlet also contains illustrations of steel castings, such as locomotive trucks, frames, truck bolsters, car parts, gears, pinions, etc. Copies of this pamphlet will be gladly sent to interested readers.

Book Reviews

The Commission of Conservation appointed by the Dominion Government have published their report on the Long Sault Rapids, St. Lawrence River. Some time ago an enquiry was instituted in connection with a power scheme which the Long Sault Development Co. proposed to launch. This report is the result of this enquiry, and contains all the expert evidence taken both in Canada and the United States relative to the advisability of granting a charter to the company. The report is exhaustive, much of the evidence being of a legal or technical nature. The part referring to ice conditions on the St. Lawrence River is both instructive and interesting. The report contains a number of excellent illustrations and three maps.

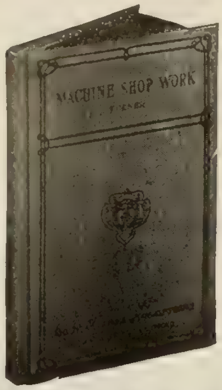
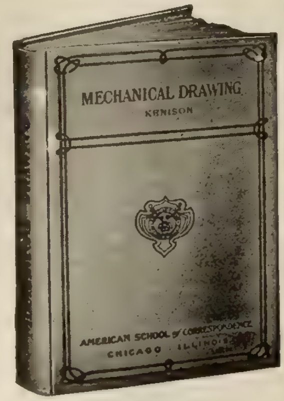
Mechanical Engineering Books

If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.

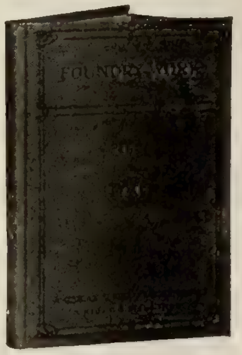


MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

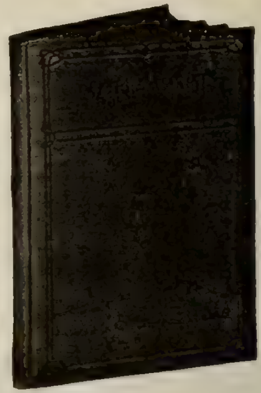


MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price $1.00

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price $1.00



PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price $1.00



MACHINE DESIGN

MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price $1.50

FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price $1.00

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels—annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price $1.50

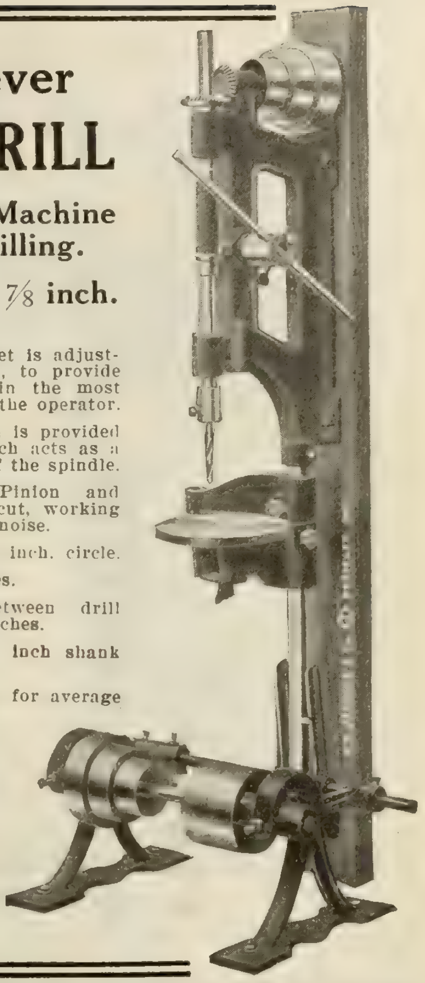
16 in. Lever

POST DRILL

A Giant Little Machine For Light Drilling.

Will drill up to 7/8 inch.



The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

Drills to centre of 16 inch. circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

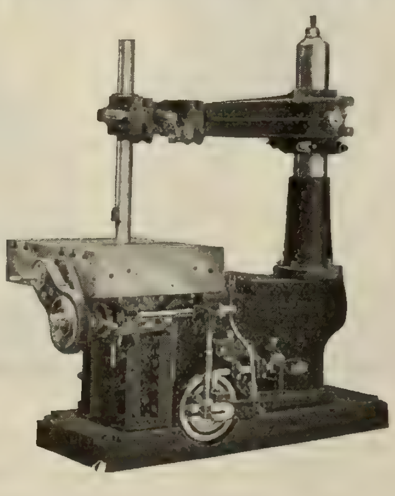
Spindle bored for ½ inch shank twist drills.

Speed of countershaft for average work, 300 per minute.

A. B. Jardine
& Co.

Hespeler, Ontario

Keyseater and Slotter



Will cut keyseats, internal gears, internal ratchets, oil grooves, miscellaneous slotting, etc., more accurate and quicker than any machine on the market.

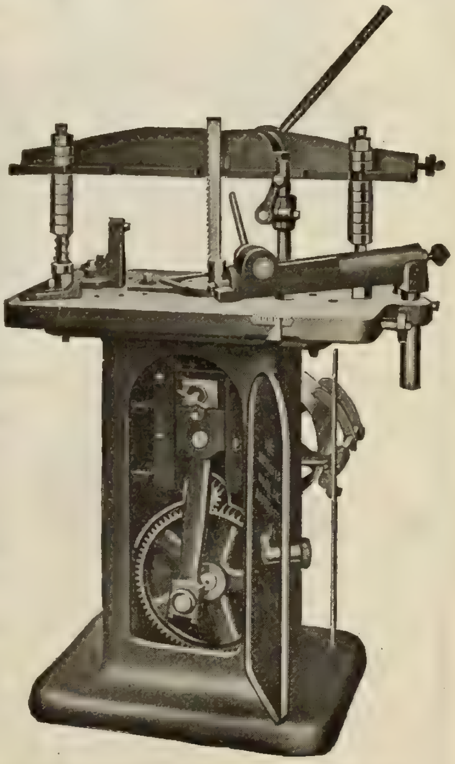
Baker Brothers, Toledo, Ohio.

Keyseating on the Davis

It becomes a simple operation as well as accurate and economical.

The feed is governed by a rack and pinion in the clamping arm and can be quickly set for rapid and accurate duplication. You can move the cutter so that its centre will cut the centre of the work without moving or readjusting the piece after it is once set.

A catalogue giving full details will be sent on request. A postal will do.



Send for Treatise on Key-seating—mailed free on request.

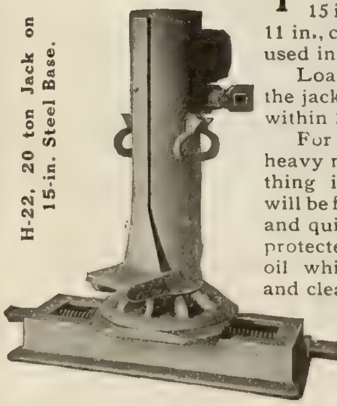
Nazareth St. — MONTREAL



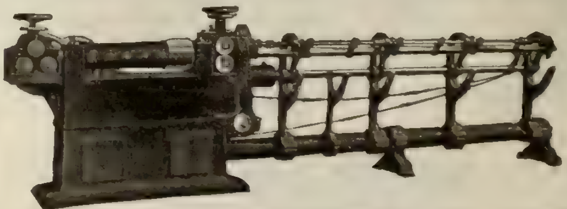
H-22, 20 ton Jack on 15-in. Steel Base.

THIS is our 20-ton jack mounted on 15 in. Steel Base, is 22 in. high, rise 11 in., can be detached from base and used in the ordinary way.

Loads of half the rated capacity of the jack can be raised on the foot from within 3 in. of the ground.

For raising or moving buildings, heavy machinery, loaded cars, or anything in the tons to handle, this jack will be found ready, reliable, convenient and quick in operation. Working parts protected, and can be practically run in oil while the outside is always neat and clean.

Manufactured by
The Canada Lifting Jack Co., Inc., Waterville, Que.
Successors to
The H. & E. Lifting Jack Co.



AUTOMATIC WIRE STRAIGHTENER AND CUTTER.

PERFECTLY STRAIGHT WIRE

is certain on our AUTOMATIC WIRE STRAIGHTENER and CUTTER, and it CUTS ACCURATE LENGTHS, not once in a while, but all day and every day for years.

It is a solid machine designed to turn out a large amount of perfect work and stand up to it.

Made in many sizes and any length required.

The F. B. SHUSTER CO., New Haven, Conn.
Formerly John Adt & Son. Established 1866.

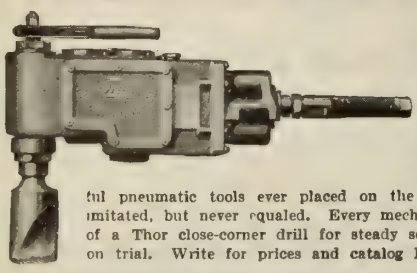
Elastic Rotary Blow Riveting Machines.

Thor CLOSE-QUARTER PISTON AIR DRILLS

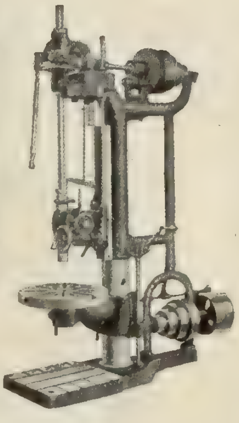


Are the original Nos. 8 and 9 motors for close-corner work. The neat and compact construction of these drills, together with the design of the mechanical parts, have resulted in their becoming the most successful pneumatic tools ever placed on the market. They are often imitated, but never equaled. Every mechanic appreciates the value of a Thor close-corner drill for steady service and economy. Sent on trial. Write for prices and catalog No. 9.

INDEPENDENT PNEUMATIC TOOL CO.

Canadian Representatives:
Thor Building, Chicago, Ill.
H. M. Petrie, Limited, Toronto and Montreal

Big Drilling Capacity at Low Cost



The 14-inch "Mechanics" has proven to be one of the most practical tools on the market and our customers appreciate this by giving us their orders repeatedly. It is an adaptable, efficient, economical machine, correct in design and construction, low in first cost and upkeep expense. Furnished with "Tapping Attachment" if desired.

"Mechanics" Drilling Machines

Are built in the following models--No. 1 Friction Drills. No. 2 Friction Drills. 14 in. Standard Drills—with or without powerfeed. 20 in. Drills—all variations. 23 in. Drills—all variations. 24, 26, 28, 32 and 36 in. Sliding Head Drills. Gang Drills—14 and 20 in. Box Column Type. 23, 24, 26, 28, 32 and 36 in. in Single Column Type.

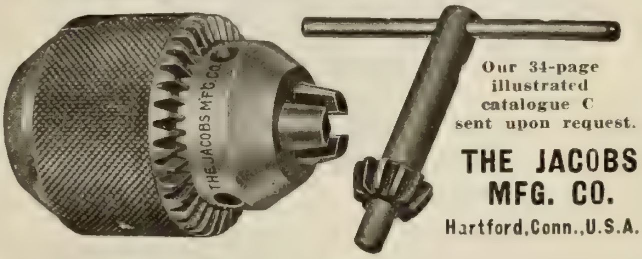
What Do You Think About it?

Our records show that more than 155,000 JACOBS IMPROVED DRILL CHUCKS have been purchased. That more JACOBS IMPROVED DRILL CHUCKS were purchased during April, 1913, than in any other month of our phenomonally successful career. We think these facts are convincing evidence that the JACOBS IMPROVED DRILL CHUCK gives satisfactory service. WHAT DO YOU THINK ABOUT IT?



Our 34-page illustrated catalogue C sent upon request.

The First Law

of nature is self-preservation. To save yourself is natural. But why need you have conditions in your plant to warrant the carrying out of this law. One of the worst danger factors you have to deal with is the projecting set screw. Why not safetify your factory by using

Allen Safety Set Screws

throughout. A small article but a great big trouble saver.

Your dealer carries them, so the next time his salesman calls just say ALLEN to him, and see how he "comes back." Send for circular!

PARAGON FLATWIST DRILL
PATENTS PENDING
THE CLEVELAND TWIST DRILL CO.

Simplest and Strongest Drive for FLATWIST DRILLS

Why?

Because the strain of driving is taken by two large surfaces and the shank is amply strong to resist this strain.

The flat taper shank is of original design. Its rounded narrow edges are a part of a true taper cone. The flat sides also taper. The drill and shank are one and the same piece of steel, forged without weld or joint from the original bar.

This drive is so strong and simple that we can guarantee the shanks unbreakable. Remember: It is a "Paragon" High Speed Drill that holds the world's drilling record.

Our circular No. 31-C gives particulars.

The "RIVETT" Ball Race Grinder

Specifications:

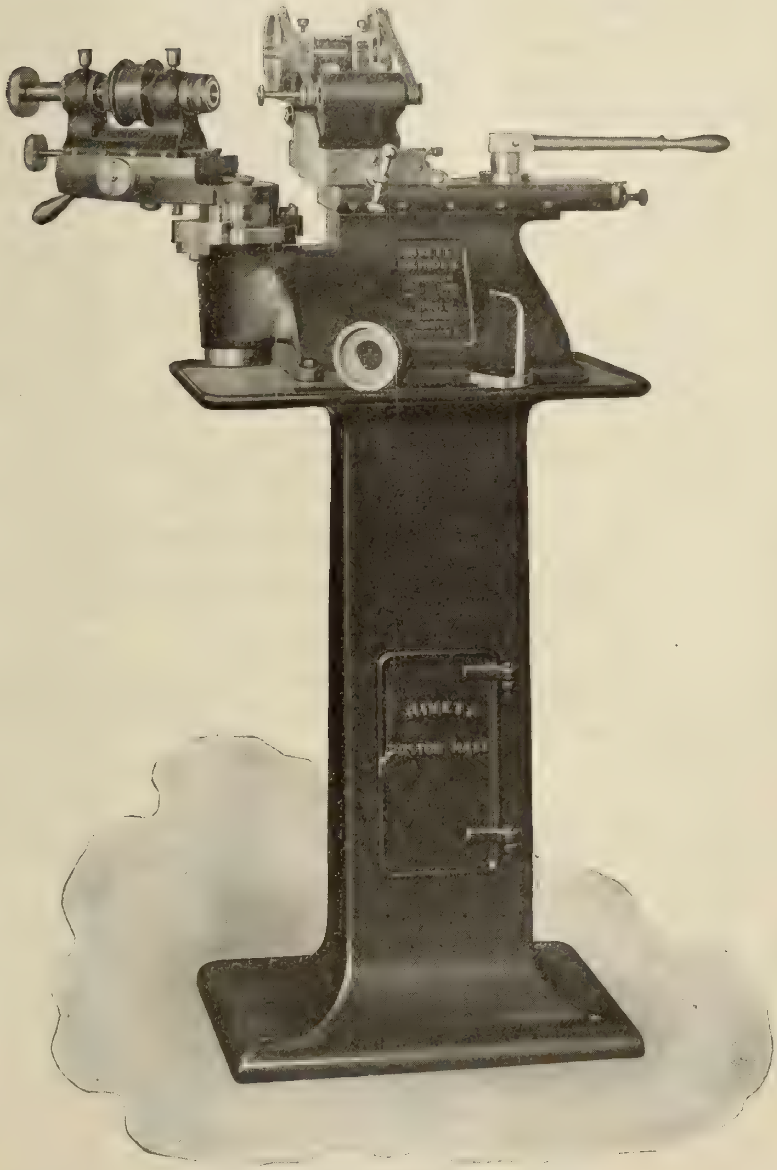
Swing over Toolpost, 9 inches

Stroke, 2 inches

Grinds Rings up to 6 inches diameter

Floor Space required 40 x 20 inches.

This Machine is equipped with a Rivett Fast Speed Grinding Spindle like all of our Grinders, and it is unquestionably the ONE Machine on the market to-day which grinds Ball Races on a Manufacturing Basis.



No. 5 Grinder, Mounted on Stand.

If you are interested, drop us a line!

Nova Scotia Steel and Coal Company, Ltd.

BEG TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

For prices and particulars apply to

Western Sales Office, Room 14, Windsor Hotel, Montreal, Que., or
Head Office, New Glasgow, Nova Scotia

The Whiting Converter

is adapted for making all kinds of steel, including such special alloys as Vanadium, Chrome Vanadium, Titanium, etc., from the smallest and most intricate pieces to those weighing several tons.

Simple to operate. Easy to install. A profitable investment wherever steel castings are used in any quantity.

Send for 16-page illustrated catalog just off the press.

Complete Foundry Equipment

We design, equip and install complete plants for Grey Iron, Brass, Car Wheel, Pipe, Steel (O.H. & Converter), and Malleable Castings. Over thirty years' experience. Send for complete set of catalogs in binder.

Cranes of all types for every service.

Don't Be a Commercial Explorer

¶ You haven't time to go exploring round on your own account discovering who's who in machinery and supplies.

¶ Time is too valuable these days.

¶ If you want to buy a machine or piece of equipment the easiest way is to consult this Directory.

¶ *The firms represented here are modern, reliable,* and their prices are right, and *they are already on the map.*

Use this modern guide to good buying.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.
TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.
TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

An Inside Story Of The Crucible

In the walls of a Dixon Crucible is spun the secret of its efficiency, durability, economy, dependability and its world wide reputation.

If walls had voices, as they are said to have ears, a story of surpassing interest could be told.

—of a concern, the largest, oldest and only one of its kind in the world founded by the inventor of the graphite crucible.

—of a concern with world-wide knowledge of graphite deposits, with use for all forms and grades of graphite and therefore with no incentive to use other than the correct form and grade of graphite in each of its many products.

—of skill in workmanship which only the heritage of 86 years of experiences and discoveries can make possible.

—of a standard which does not permit of anything but absolute uniformity of the highest possible order.

In satisfaction alone it is worth while buying Dixon Crucibles, and in the economy of service Dixon Crucibles are supreme.

Write for booklet No. 223A. "The Care and Use of Crucibles."

Made in Jersey City.

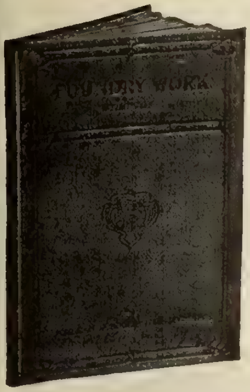
DIXON TRADE MARK

You May Have This Book Without Spending a Cent

if you are a subscriber to "Canadian Foundryman," by sending in to us four new paid-up subscriptions. If you are not a subscriber send in your own, along with the proper number of paid-up subscriptions and the book is yours.



Foundry Work
By Wm. C. Stimpson
Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute.

160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc.

Price, $1.00

Given free with four yearly paid-up subscriptions.

The subscription price is fifty cents per year; two years for one dollar.

IRON CEMENT SMOOTH-ON No4 No4

SMOOTH-ON
TRADE MARK REG. U. S. PAT. OFF.

SMOOTH-ON
IRON CEMENTS
No. 1, No. 2 and No. 3

Permanently stop all leaks of steam, water, fire or oil, in iron or steel castings, boilers, tanks, piping, pumps, screw thread joints, flanged joints, etc.

Smooth-On No. 4 is unequalled for filling in blowholes in iron or steel castings.

The Smooth-On Cements are easy to apply and make permanent repairs, proved by years in use.

Every engineer should read our new No. 12 illustrated instruction book—FREE. It tells when, where and how to use the different Smooth-On Cements. Send for it now.

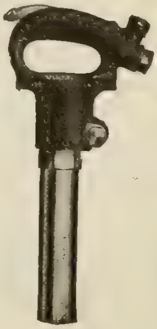
CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

Sand Rammer in operation.



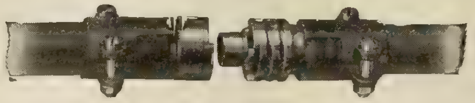
CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000 in General Use.

Bowes Couplings are instantly connected or disconnected.



Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock: — RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Catalog No. 12 mailed on request.

THE MISSING LETTER

You know the beautiful, blue, smooth surface of a Casting is one of its essential qualities.

You know its appearance acts as a silent salesman for that same casting.

You know, also, that the cost is less when the Foundry produces this effect without the aid of the Scratch-room or the Chipping gang.

You, perhaps, know it is possible to procure a Plumbago-Ceylon Lead—that will produce that effect.

Perhaps in the mazes of substitutes sailing under a similar name you have forgotten that I import from Ceylon's Coral Strand just that kind.

Its cost is less—at the end.

The same high standard of excellence pervades, with pocket-book popularity, my entire line of Foundry Facings and Foundry Supplies.

If your letter of inquiry is not missing in my mail, I will tell you more about it.

FREDERIC B. STEVENS
MANUFACTURER

DETROIT, MICHIGAN. **Export Warehouse: Windsor, Ont.**

---

a sign of good profits

FOR YOU--FOR EVERY FOUNDRYMAN

Shelton Metallic Filler

is a guarantee for *bigger results* in any foundry ---it eliminates *make-overs.*

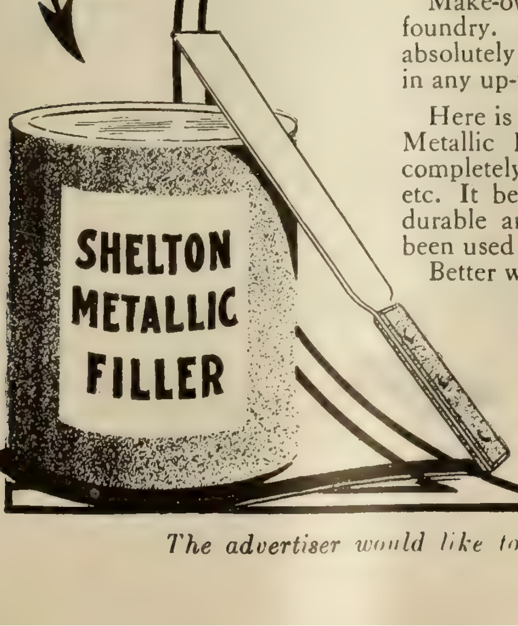
Make-overs are the profit consumers of the foundry. They are a form of waste that is absolutely useless, and should not be permitted in any up-to-date shop.

Here is a chance to stop your losses. Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years.

Better write to us at once.

Every casting means a profit if you are a user of SHELTON METALLIC FILLER

At a slight cost the "bum" casting can be made as good as the *best---don't throw it on the scrap heap.*



SHELTON METALLIC FILLER CO.
DERBY, CONN.

The advertiser would like to know where you saw his advertisement—tell him.

High-Speed Steam-Hydraulic Forging Presses

Double your production with one-half your labor cost and steam consumption Cost of repairs reduced. Eliminates heavy shocks and vibration.

"SINGLE LEVER CONTROL"

Small sizes—single-frame type. Large sizes—four-column type.
Built for doing all classes of forging, shearing or pressing

100 Tons to 12,000 Tons Capacity

The Lathe of Maximum Production

WE have put into this new Gap Lathe every feature that makes for economical production — speed in changing, accuracy of cut, quality of cut, and solidity of bed.

All parts taking strain are of ample excess size, and all bearings are large. The gap is solidly supported, and is of extra width and depth.

Correspond with us for full particulars. You can instal one or a battery of these machines in any size of gap within wide limits, and in any length of bed, Write us.

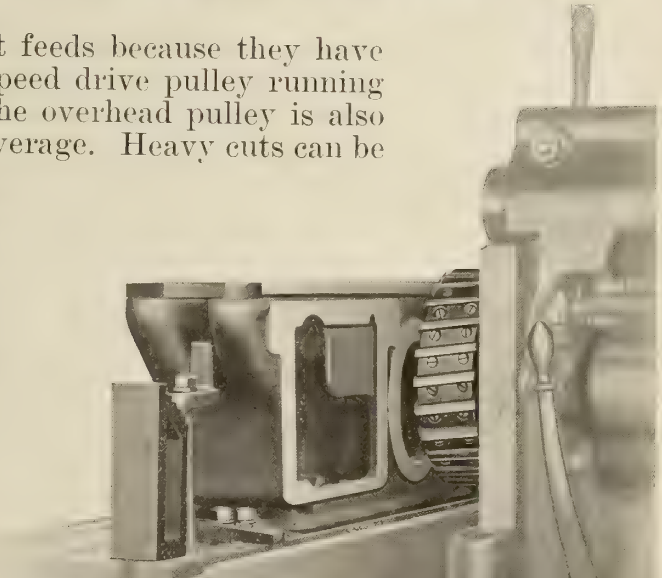
Face Milling For Fast Production

These Machine Beds are rough milled on the side, as indicated opposite, at a rapid rate. A high speed steel B. & S. inserted tooth cutter is used and each bed is lined up against a parallel, obviating the necessity of lining up the casting every time or setting the saddle for depth of cut. Is there not similar work in your shop on which a powerful milling machine will effect considerable saving? You can be sure of rapid production on such work because

Brown & Sharpe Milling Machines
Are Designed For Heavy Service

Our machines drive large cutters at fast feeds because they have ample power. Large diameter constant speed drive pulley running at high speed carries an extra wide belt; the overhead pulley is also large, thus insuring a powerful driving leverage. Heavy cuts can be taken without undue vibration because the design is consistently rigid. The several members have thick walls with stout internal bracing, and where possible are of deep box form to resist springing. Bearings are broad and present large supporting surfaces at the points of maximum stress.



Send us blue prints of your castings and let us aid you in obtaining maximum production.

Brown & Sharpe
Mfg., Co.

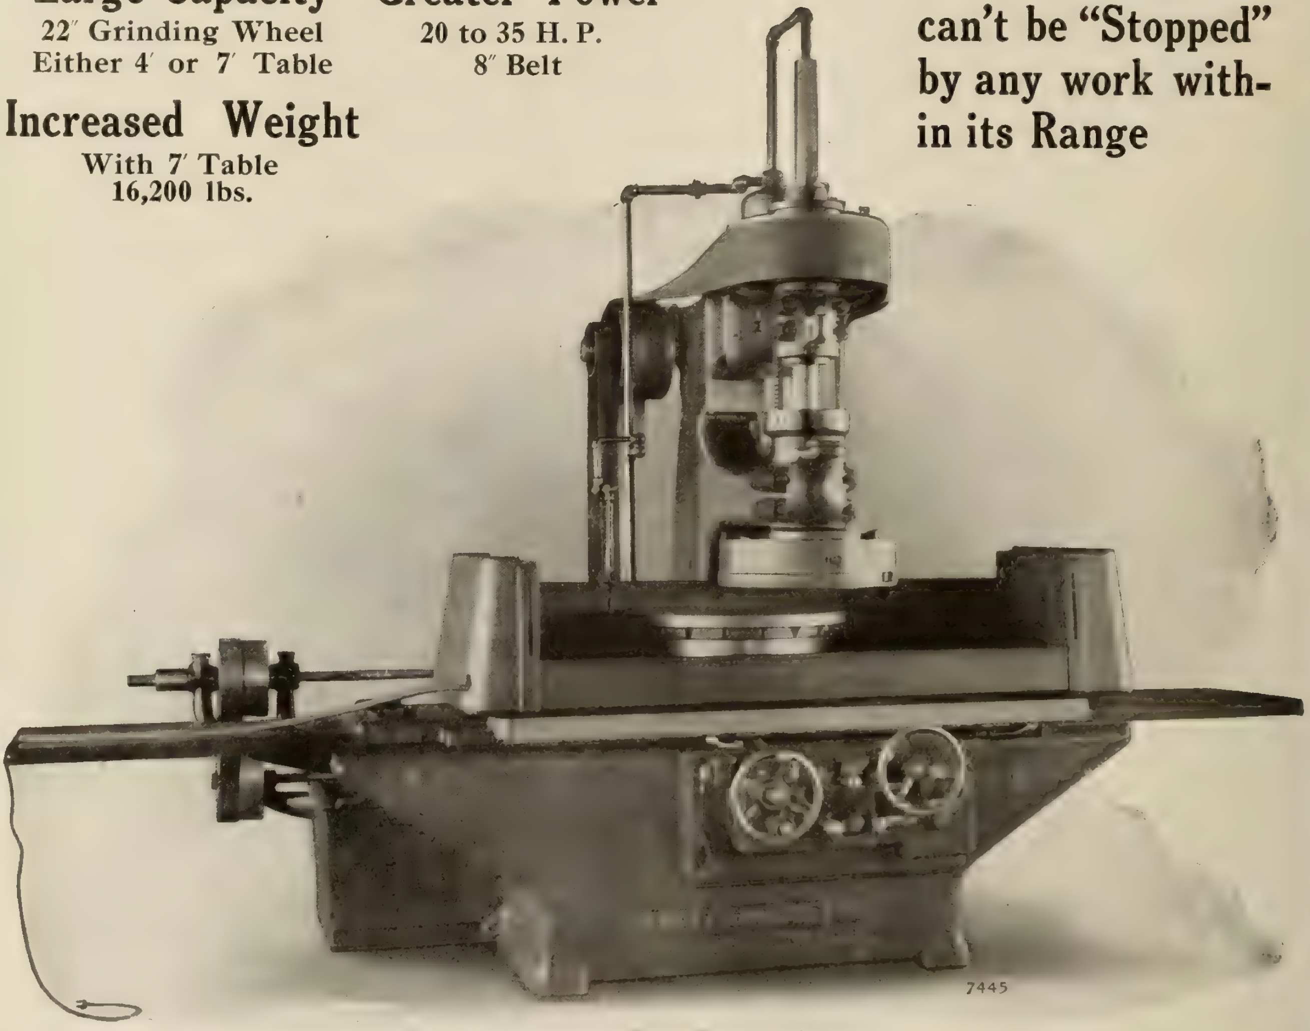
The Machine that can't be "Stopped" by any work within its Range



Massive Construction

Special attention is called to the unusual proportions and massive design of this new surface grinder. The machine has been designed with the idea in view that it must have unquestioned stability, an abundance of power and must retain its accuracy under the most severe service.

Ball Bearings

The spindle and driving pulley are provided with ball bearings throughout. Loss through friction is thus reduced to a minimum and practically the entire power is utilized for driving the wheel.

Power Traverse for Table

In addition to two power feeds, the table is provided with power quick return motion for use in connection with rotary chucks.

Flexible Work-holding Devices

The various work-holding appliances are very flexible and will accommodate a wide range of work. The machine may be furnished with rectangular reciprocating, and single, double and quadruple rotary chucks of either plain or magnetic type.

Write for "Progress Reporter" No. 24, containing description of this grinder and several other new machines.

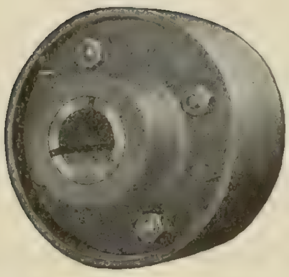
SHAFTING COUPLINGS

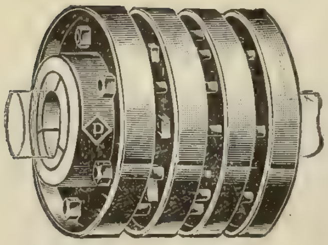
Solid Sleeve

DODGE SOLID SLEEVE

A low-priced coupling designed for light shafting, has countersunk set screws, and is finished over entire surface.



Single Compression



Double Compression

DODGE KEYLESS COMPRESSION

Built on the most liberal lines and calculated to furnish the manufacturing and supply trade with a coupling that can be had immediately from stock, and may be depended upon at all times to couple shafting without keyseating or keys, thus affording ease and despatch in erecting at a minimum cost. Made in two styles, Single and Double Compression. For shafting up to 2 7-16 inch diameter, we recommend the single compression coupling for ordinary duty. For larger shafting, we recommend the double compression coupling.

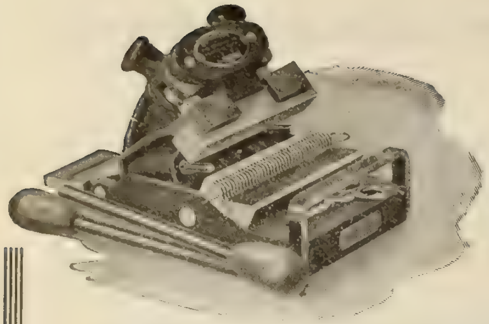
Everything for the Mechanical Transmission of Power

TORONTO **MONTREAL**



We Offer This "Clipper" TRADE MARK Belt Lacer for $20.00

Duty Paid f.o.b. Nearest Canadian Agency;

It will pay 10% a month dividend every time you lace a belt with it.

Minutes are dollars when a belt gives way. Clipper time is about 3 minutes as compared with ten to fifteen minutes the old way, and every machinist laces his own belts. No expert is necessary.

Have a "Clipper" on each floor or in each department of your plant. When a belt gives way the machine operator rushes for the machine (weight 19 lbs.) and carries it to his broken belt. In a minute he has a row of steel Clipper loops affixed in one belt-end; another minute fixes the other end, and in the third minute he has the two ends joined over the pulley with our Fibro pin, and his machine is back at work.

30-DAY FREE TRIAL OFFER.
Let us arrange with our nearest Canadian agent to let you try this machine for 30 days, at our risk. Particulars by mail.

How much coal
Do You Waste
By poor power
Transmission?

Power experts agree that in the average plant only 40% to 50% of the coal pile is eventually employed in running the machinery. The rest is lost.

Inefficient pulleys, or those carrying unnecessary weight, are among the large contributors to power "leakage" and coal waste.

Copyright, American Pulley Co., 1913.

"American" Steel Split Pulleys

Perfect in Principle Powerful in Performance

are the original steel pulleys and embody the latest improvements founded upon correct basic principles. On such a foundation is built the "American" pulley's title of "The Standard of Pulley Efficiency."

"American" pulleys are made in diameters of 3 to 60 inches inclusive.

Discuss your pulley problems with the nearest "American" dealer or—

Patented.

Now He Knows

But if he had known sooner he would have saved his firm many dollars. Why? Well, this grinder was the only one in the shop. No one had taken the trouble to find out if it was running up to speed. Then this machinist came to the shop. He had a little instrument in his kit that had cost him only $1.50. With it he took the speed of the grinder. *It was running at only two-thirds of the rated speed.* The machine was speeded up and the cost of a new grinder was soon saved. Pretty good, wasn't it? Oh,—the instrument? It was a

Starrett Speed Indicator

It will record the highest speeds without heating.

It is a nicely finished reliable instrument with all working parts enclosed like a watch.

All sorts of uses for it will occur to you such as speed tests on line shafting, grinders, buffers, emery wheels, engines, turbines, gas engines, motors, fans, etc. The indicator is furnished with rubber tips for centered, or square end shafting.

Let us send you catalogue 203 describing the various styles or have your hardware dealer show you one.

WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 13—Tools for the Miller

We are, first and foremost, manufacturers of milling machines and we devote our best efforts to making these machines capable of producing maximum results.

In line with this endeavor we have spent much time and thought upon the selection of certain tools of classes that are always useful and these tools we have divided into sets which experience has taught us are suitable for each size of Milwaukee Millers.

Our sole object in doing this has been to aid our customers to obtain maximum results from our machines—results which they might not be able to obtain were these tools not at hand to be employed on actual work as well as to serve as models for tools of other dimensions that might be required on special work.

We do not seek orders for these sets of tools with an eye to building up a business in this line. We offer them only as a supplementary service to our customers.

The selections which we have made furnish something of real and practical value. Mechanics of broad experience who have purchased Milwaukee Millers equipped with our sets of tools declare them to have been exceptionally well selected.

Lack of space prohibits our telling the interesting points and extent of application of the set of tools for No. 3 Milwaukee Millers shown herewith. Those who write for these facts will get information that is decidedly worth while. When writing ask for the complete Bulletins, giving the "*Whys*" in favor of Milwaukee Millers.

No User of Ball Bearings Can Afford to Neglect These Points

1 **Double Row of Balls**—virtually two bearings in one—a splendid feature under any load condition.

2 **Pressed Retainer in One Piece**—made from Swedish Lancashire Iron. No rivets, wires or screws to work loose, jam balls, disarrange spacing or make noise.

3 **Outer Race Spherical**—providing for a frictionless self-alignment that absolutely and automatically compensates for shaft spring.

4 **Best Swedish Crucible Steel**—Carefully heat-treated and uniform in hardness throughout. Unequalled for toughness, carrying capacity, accuracy and durability.

SKEFKO

is the only truly self-aligning bearing. **This feature** alone is worth most careful consideration.

SKEFKO Self-Aligning Double-Row, Double-Capacity, Double-Life Ball Bearings cost no more and are made in international standard sizes. Their use is practical under any speed and load condition and the lubrication and protective housing can be made to conform to any service requirements.

SKEFKO are the recognized standard and are replacing other constructions in many types of machinery.

Our literature explains these matters in detail. Your best interests demand that you investigate. Tell us your bearing troubles and ask for our bulletins.

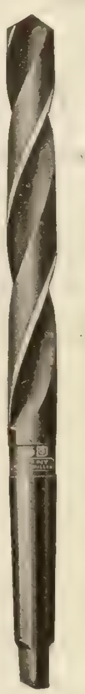
On Their Metal

The reputation of "Detroit" Tools rests largely on the steel that goes into them. This steel is treated and tempered by men whose scientific knowledge and experience perfectly qualify them for such vitally important work.



"Detroit" Twist Drills

In addition to the best small tool steel and exact heat treatment, "Detroit" Drills are made with the most exacting attention to detail.

They are ground to the 1-2000 of an inch and every drill passes through the inspector's hands from three to eight times before it is allowed to go to the "finished product" room. Catalog "R" shows over 4000 small tools including drills from 135-10,000 of an inch up to 6 inches in diameter. And every one bears our trade-mark guarantee.

Test "Detroit" Drills on a tough job.

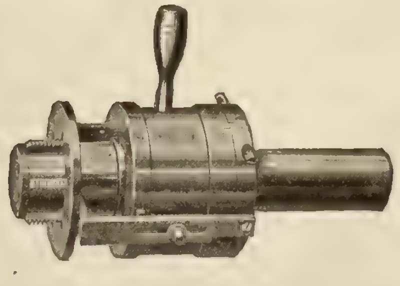
This Guarantee Goes With Every Vise: We fully guarantee all of our Vises to be satisfactory in every particular and will promptly replace, without cost, any parts broken or badly worn when such failures are due to faulty material or construction.

There is no Backing Out

Where **GEOMETRIC ADJUSTABLE COLLAPSING TAPS** are used



They are made to collapse their chasers automatically. Thus, when the desired length of thread has been tapped, the Tap is withdrawn without touching the finished thread.

Can be applied to Turret Head Machines or Live Spindles.

When the chasers become worn beyond regrinding they are renewed at small cost, and the Tap remains as good as new.

GEOMETRIC COLLAPSING TAPS HAVE EVERYTHING TO RECOMMEND THEM.

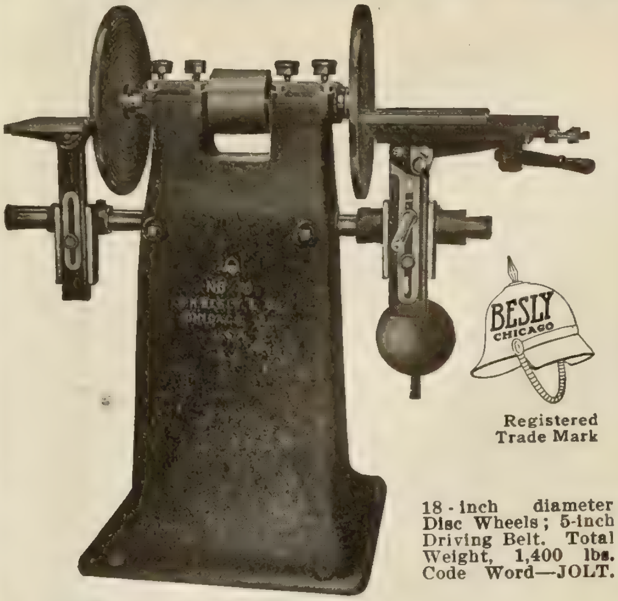
Write for descriptive Booklet.

THE GEOMETRIC TOOL COMPANY

NEW HAVEN, CONN.

Canadian Agents: Williams & Wilson, Montreal.
The A. R. Williams Machinery Co., Toronto.

The World's Most Popular DISC GRINDER



Registered
Trade Mark

18-inch diameter Disc Wheels; 5-inch Driving Belt. Total Weight, 1,400 lbs. Code Word—JOLT.

NO. 10-18.—G. BESLY GRINDER.

For general Fitting and Finishing, and Manufacturing operations, requiring 18-in. diameter disc wheels.

One of the most useful tools known to machine shop practice.

Costs only Six Cents a Day for Interest on Investment.

Making Good and Making Excuses.

¶ The peculiar thing about the man who never makes good is his marvelous ability to trump up excuses showing 'why and how' he could not.

¶ The man who tells you that he will meet you at a certain hour and is not there, will invariably see you next day with a blanket of finely woven excuses which would do justice to an attorney attempting to get a new trial.

¶ There was once a solicitor connected with a big business concern who did not solicit. He told a few stories, including one about his salary, and always in conversation he drew just twice what he really got and what he really got was just twice what he was really worth.

¶ The man who never *does* is always busy telling folks why he *didn't*. He evades direct answers just as he does direct action. He is always *going* to do something, but never gets around to it. In the world of excuse he is a genius, but no one is ever able to place a finger on anything that he has actually done.

¶ The work of some people consists in getting to and from the office, although their contract calls for business. This type of individual takes up the time of those who are usefully employed, telling just how he 'almost' landed a contract or made a sale. He may be punctual to the minute, but delivers nothing on his arrival.

¶ This type of man believes that 'being around' is being on the job, that getting down to the office is getting down to business, that swelling up over a thing is swelling the receipts.

¶ When this type of man is discharged from his job, which of course he always is in due course of time, he tells his friends how 'someone had it in for him,' and that his discharge is the result of a conspiracy formed by a few head men who were afraid of him.

¶ He is always late, always detained, always busy, always sick—anything and everything except *always on the job* at the time he is supposed to be.

¶ *The moral*: the world has no use for such a man and he is only used to fill in until it is possible to get the real thing.

Efficiency

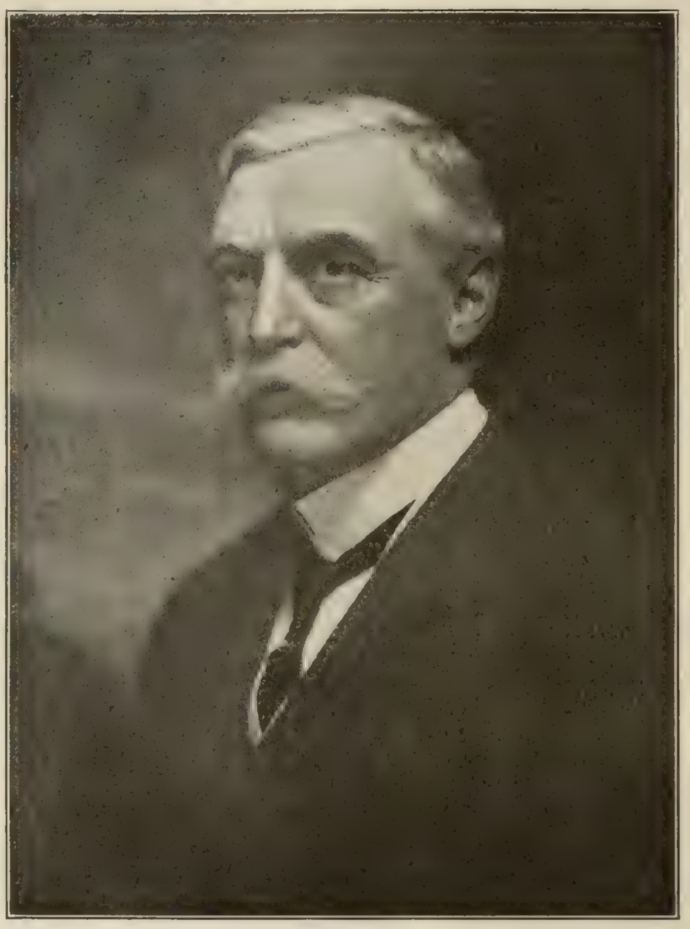
These articles are copyrighted, and must not be reproduced in part or whole without the permission of The MacLean Publishing Company.

ROBERT HOBSON

THERE are some men who baffle description. They may be men of many parts, great men, geniuses, yet it is impossible to put a finger on a characteristic and say, "There lies his greatness." Such a man is Robert Hobson, vice-president and general manager of the Steel Company of Canada. An employe, speaking of him recently, said: "He is the whitest man I ever met." He went on with his panegyric, saying: "He is one of the smartest men in the steel business to-day, and he is square. If you approach him on a subject, even though it is against the interests of the Company, he will not give a decision right off the bat, but will weigh it on both sides of the balance. When you go back to him, his answer is there, ready."

There is probably no man better liked in the industrial world of Canada. He possesses a most pleasing personality, and is a good mixer. No better evidence of that could be found than the fact that he is a bosom friend to his chief competitors, particularly James A. Farrell, president of the United States Steel Corporation.

With the railway men of Montreal no one stands in better than Robert Hobson, which is not detrimental to the business of the Steel Company of Canada. He was once a railroad man himself. His father, Joseph Hobson, was chief engineer of the Grand Trunk Railway, and built and designed the tunnel under the St. Clair River. It was only natural that his son Robert should become interested in railroading, too. He began work in the engineering department of the Great Western Railway, and continued with that road until it became part of the Grand Trunk System. When the G.T.R. headquarters were moved to Montreal in 1896, Robert Hobson remained behind, and became secretary-treasurer of the Hamilton Blast Furnace Co., at Hamilton.



ROBERT HOBSON.

On the amalgamation of the Hamilton Blast Furnace Co. and the Ontario Rolling Mills Co. under the title of the Hamilton Steel & Iron Co., he was appointed secretary and assistant general manager of the corporation, and in January, 1901, he was made vice-president and general manager. On the consolidation of the Hamilton Steel & Iron and Canada Screw Companies of Hamilton the Canada Bolt & Nut Co. of Toronto, the Montreal Rolling Mills, and the Dominion Wire Companies of Montreal, under style of The Steel Company of Canada, he became the vice-president and general manager. He is a director of the Canadian Locomotive Co. of Kingston, of the General Accident Assurance Co. of Toronto, of the Landed Banking Co. of Hamilton, and of a number of other corporations. He is a member of the American Institute of Mining Engineers, and a director of the American Iron & Steel Institute, member of the Hamilton Club of Hamilton, of the Toronto Club, Toronto, the Rideau Club of Ottawa, and the St. James' and Montreal Clubs of Montreal. He is also a past president of the Canadian Manufacturers' Association.

Mr. Hobson was married in 1891 to Mary A. Wood, daughter of the late Hon. A. T. Wood. He is fifty-two years of age, having been born at Berlin, Ont., on August 13, 1861. Much charitable work is performed in Hamilton by Mr. and Mrs. Hobson, but it is done in a quiet manner, which is typical of the man.

The Value of Compressed Air Equipment in the Foundry*

By Arthur F. Murray, M.E. **

Compressed air and electricity are two prominent factors in the development and achievement of the foundry as we find it to-day, and each fills a distinct place as the motive power for the operation of the equipment installed. Foundrymen appreciate the new conditions under which work is now performed, and in the matter of what has contributed most largely to their improved status, the consensus of opinion favors compressed air.

THE foundryman is up against an ever-increasing cost per unit for raw materials and labor, and at the same time faces such brisk competition that he is forced to lower rather than increase his selling prices. Increased operating efficiency presents the only remedy. Labor is the largest single item of foundry expense, and the introduction of machinery makes possible large reductions in labor cost. Compressed air and electricity have become foundry necessities.

We seldom realize the importance of the role that compressed air has played in the tremendous industrial strides of the past generation. Without the shield and rock drill, the $150,000,000 tunnel and terminal of the Pennsylvania Railroad would have been impossible. Without the riveting hammer and caisson, there would exist scarcely a single skyscraper in our cities. In the foundry, the effects have been almost as great. The compressor, chipping hammer, sand rammer, moulding machine, sand-blast, sand riddle and air hoist, have become parts of every well organized foundry. It is impossible here to give a complete presentation of the subject in one short article, so an attempt will be made to deal with the least known applications of compressed air, passing over rapidly such items as chipping hammers, sand rammers and air hoists.

The Compressor Feature.

The foundry compressor must be as nearly as possible dirt-proof, and foolproof. Compressors that stand up well in clean surroundings, with skilled attendants, frequently go all to pieces in the dustladen atmosphere of the foundry where the skilled attendants are conspicuous by their absence. Enclosed frame types, recently developed, vertical single-acting in small sizes and horizontal double-acting in larger sizes, meet a long felt need for foundry service.

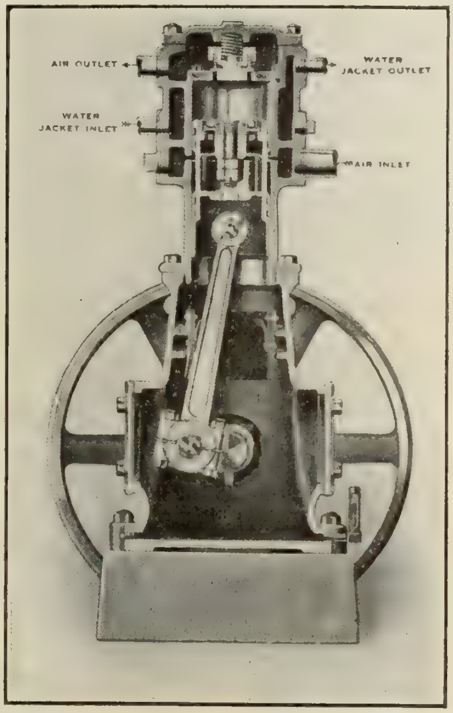


FIG. 2. SECTIONAL VIEW VERTICAL HIGH SPEED AIR COMPRESSOR.

Foundries may be divided into three classes:

(a)—The novelty foundry with light work and requiring air for operating a few vibrator machines and perhaps a small sand-blast. For these, a compressor of from 10 to 75 cu. ft. displacement is often sufficient.

(b)—The average jobbing foundry with from 5 to 20 tons daily output should have a compressor of from 200 to 500 cu. ft. displacement.

(c)—The large foundry may use up to 1,500 or 2,500 cu. ft. displacement.

Small Compressors.

The novelty foundry with a small air requirement has, until recently, found difficulty in obtaining a satisfactory compressor. The advent of the automobile has brought forth a number of machines for garage service in pumping up automobile tires. Some of these machines are admirably suited to novelty foundry work.

Fig. 1 shows a Clayton garage compressor close belted to electric motor, which has been applied to this service in a number of cases. It is arranged with automatic starting and stopping device, pressure tank, etc. In addition to being used as compressors, this type can be used as vacuum pumps. One of them is being used in the Blake-Knowles foundry for operating suction moulding machines of the "Bryan" type.

Fig. 2. shows a section from which the dust-proof, self-oiling construction is apparent. Removable bearing linings and light weight valves are important features. This type is furnished in single, duplex and triplex machines, up to 65 cu. ft. displacement.

Medium Sized Horizontal Compressors.

Fig. 3 shows a type of machine which has been developed particularly for foundry service. It is the horizontal, enclosed frame, splash-lubricated type.

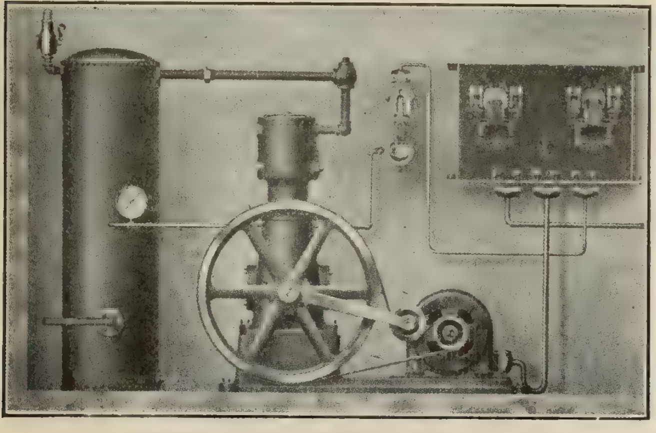

FIG. 1. AUTOMATIC AIR COMPRESSING EQUIPMENT.

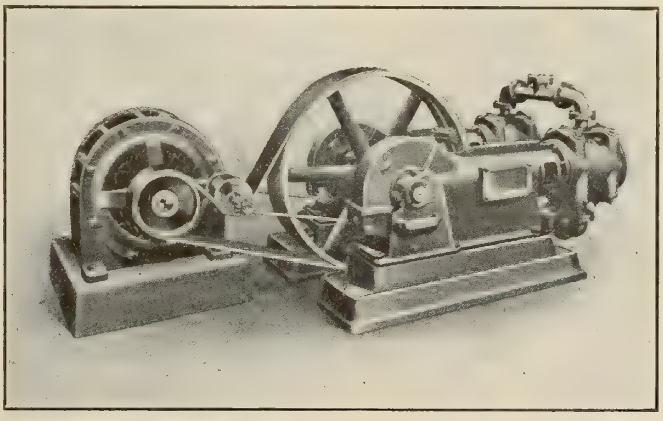

FIG. 3. DUPLEX ENCLOSED FRAME, SPLASH LUBRICATED AIR COMPRESSOR.

---

*From a recent talk to the Philadelphia Foundrymen's Association.

**Equipment Engineer, the Blake & Knowles Steam Pump Works, East Cambridge, Mass.

These machines are built both single and duplex, steam and power-driven. Fig. 3 shows a Clayton duplex compressor, motor driven by close belting with weighted idler. This method of drive is to be preferred to either chain or gear drive, and is now practically standard among the leading manufacturers.

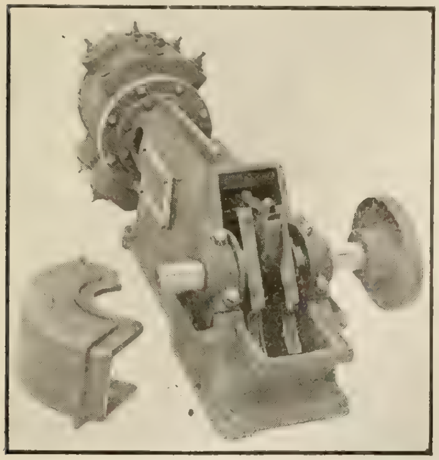

FIG. 4. SINGLE ENCLOSED FRAME, POWER DRIVEN AIR COMPRESSOR WITH FRAME CAP REMOVED.

Fig. 4 shows a single 12x8 Clayton machine with flywheels and crank cover removed, in which the splash oilers are seen, while Fig. 5 shows a cross section of a 10x10x10 steam-driven compressor also built by the Clayton Air Compressor Works, from which the general construction is noticed.

Fig. 6 shows the construction of the featherweight valves required for the efficient operation of compressors at high speed.

Two-Stage Compressors.

Fig. 7 shows a 16x10x10 duplex two-stage compressor with heavy belt wheel for connection to electric motor. Best practice demands pressure of 80 to 100 lbs. per sq. in. for the service lines of the foundry. Where the machine is to be motor driven with purchased power, the lower power consumption of the two-stage machine will soon make enough difference in the power bill to pay for the extra cost. Of course, the economy is not affected by the fact that the power is purchased, but the results are more effectively brought to the attention. The two-stage machine will run cooler and show a higher volumetric efficiency, i.e., ratio of piston displacement to actual cubic foot equivalent free air delivered. It will usually be found profitable at 80 to 100 lbs. air pressure where a displacement of 300 cu. ft. per minute or over is required, whether the machine is steam or power driven.

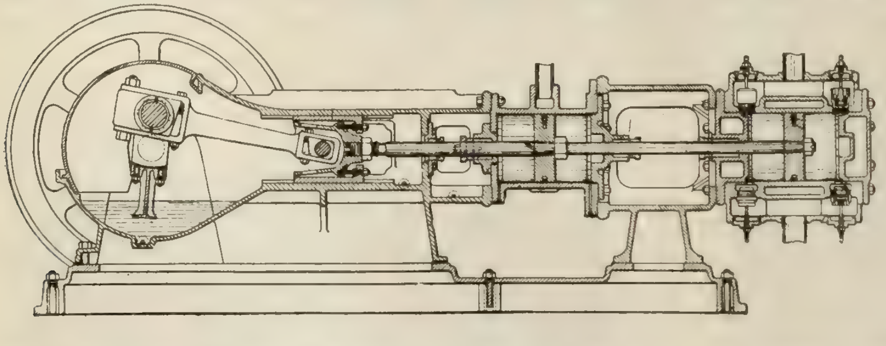

FIG. 5. SECTIONAL VIEW OF ENCLOSED FRAME SELF-OILING STEAM-DRIVEN AIR COMPRESSOR.

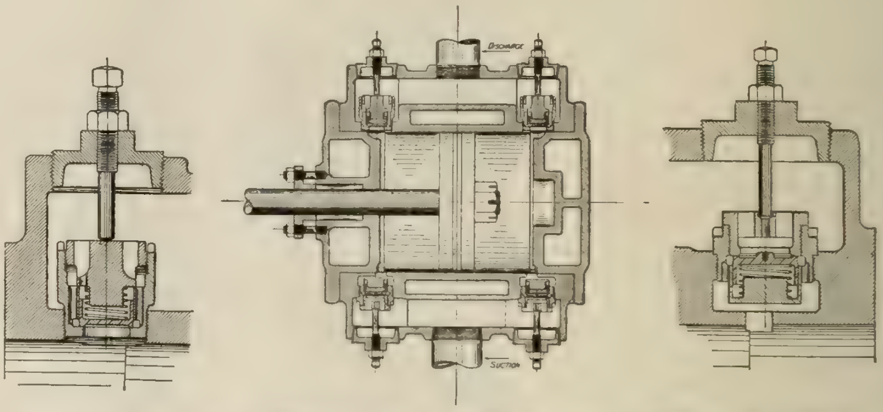
Fig. 8 shows an 11x17½x11x10 duplex two-stage Clayton compressor with Cincinnati valve gear on the low pressure cylinder. Volumetric efficiencies of from 90 to 95 per cent. are obtained at 100 lbs. pressure with this type of air valve gear.

Fig. 9 is a table showing horsepower and temperature for isothermal and adiabatic, single and multi-stage air compression which impresses the value of two-stage compression for the higher pressures.

Pipe Lines.

Piping should be as direct as possible with no undrained pockets or loops where moisture can accumulate and where freezing can occur in cold weather. Separators should be installed at low points on the line. These may be either the ordinary type, similar to steam separators, or may be air receivers. It is a good plan to locate a steel receiver of 25 to 50 cu. ft. capacity at points where there is a large fluctuation in compressed air demands. This combines the action of separator and equalizer, although it will not sustain the service if the compressor shuts down. Fittings should be of the "long turn" type, and all shut-off valves of the gate type. All shut-off cocks on taps should be of heavy pattern and good quality. The piping should be installed with care to insure a tight line, and be well supported so that the joints cannot shake loose. A single ⅛-in. orifice will deliver 21.2 cu. ft. of free air per minute at 80 lbs. pressure, and the importance of preventing leakage is therefore readily seen. Hose should be heavy and preferably armored. Quick acting couplings should be supplied at both ends to prevent the reprehensible practice of twisting it up before screwing it into a tool connection.



DISCHARGE VALVE. SECTION OF AIR CYLINDER. SUCTION VALVE.
FIG. 6. CLAYTON "FEATHERWEIGHT" AIR VALVES FOR HIGH SPEED AIR COMPRESSORS.

Applications of Compressed Air.

Handling Materials.—Air hoists, pneumatic elevators, pneumatic cupola charging machines, fuel oil systems.

Core shop.—Core carriage hauling devices, core sand preparation (pneumatic riddles).

Molding floor.—Molding machines, plain jolt or jarring type, combination jarring and squeezing types, combination jolt ram and pattern drawing types, plain vibrator types, power squeeze types, power squeeze, power draft types; power squeeze, power roll-over, power draft types; power sucker types with vibrator, pneumatic rammers, pneumatic molding sand sifters or riddles, plow guns, spraying devices.

Cleaning room.—Pneumatic chippers, sand blasts—high or low pressure, sand blast tumbling barrels.

A special form of pneumatic elevator is the cupola charging machine. There is a type for use where the charge requires no lifting, and a compound type in which the charge is both lifted and tipped by the machine. These devices are rapidly coming into favor.

A great many foundries use fuel oil for skin drying, melting furnaces, core ovens, etc. The air displacement system is a simple means of transporting this from the place of storage to the place of use. In this system, air is not applied directly to the storage tanks, but alternately to two small pressure tanks which receive their supply of oil by gravity from the main storage tanks. Simple crossover valves are used and changed over once or twice a day, usually by hand, but sometimes automatically.

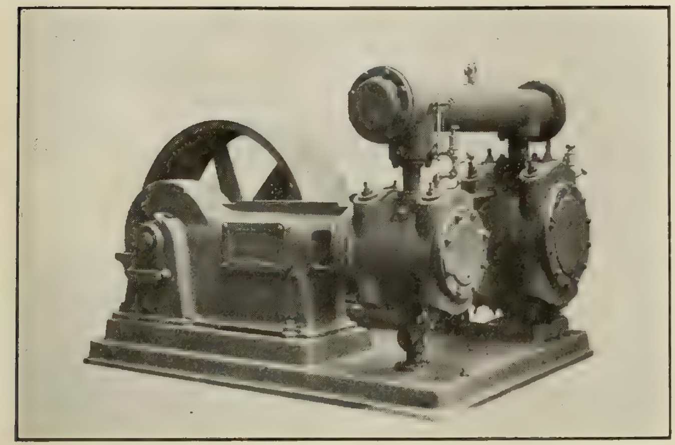


FIG. 7. HORZ. DUPLEX, ENCLOSED FRAME, BELT DRIVEN, TWO STAGE AIR COMPRESSOR, POPPET INLET VALVES ON LOW PRESSURE CYLINDER.

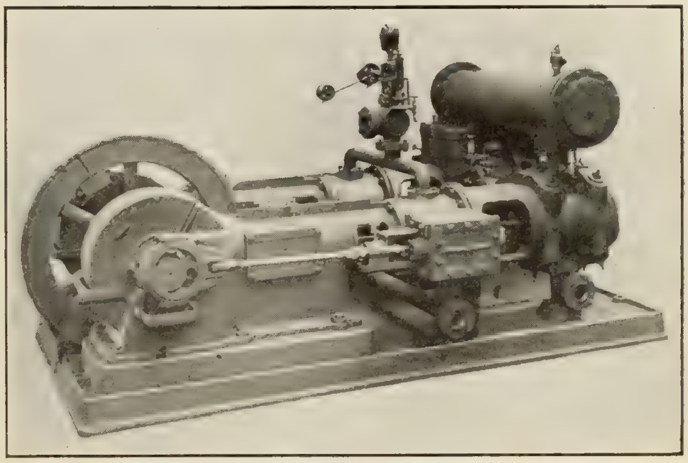

FIG. 8. DUPLEX ENCLOSED FRAME, TWO STAGE, STEAM-DRIVEN AIR COMPRESSOR.

The Core Room.

The handling of core carriages has always been a troublesome job. Fig. 10 shows a simple compressed air haulage device which is self-explanatory. The mixing of core sand by compressed air is frequently done by means of the pneumatic riddle shown in Fig. 11. The coreroom is often a neglected part of an otherwise up-to-date plant, therefore, opportunities for savings are usually good. If core costs can be sufficiently reduced, the entire molding practice may be radically changed, coring taking the place of difficult pockets, loose part work or multiple part flasks.

FIG. 9. THEORETICAL HORSE POWER REQUIRED TO COMPRESS ONE CUBIC FOOT OF FREE AIR.

A large saving may be made by using "core jolt" machines. They make the manager smile, and the pattern-maker "holler." For success on the core jolt machines, boxes must be substantially built or they will be knocked to pieces, but the cost of a well-built core box is little more than that of a poorly built one, and the use of core jolt machines will reduce most core costs twenty-five to fifty per cent.

Pneumatic Molding Machines, Jarring Types.

One of the most remarkable changes in foundry practice during the past five years has been caused by the general adoption of the "pneumatic jarring machine," "jolt rammer," "bumper" or "bouncer," as it is variously termed by makers and users. No other single type of molding machine is applicable to as wide a range of operation or requires as little special pattern and flash work. The most remarkable thing about it all is that the jarring machine was invented in 1869, yet was forty years in coming into its own.

Fig. 12 shows a 16 in., 72 by 72 in. machine and a small corner of its molding floor in the Blake & Knowles foundry. Things to be noted are the electric jib crane and the air hoist installed especially for setting cores and finishing molds rammed on the jarring machine. The control valve and air pressure gauge will be observed alongside the wall. The hoists are in addition to the two overhead travelling cranes on the 200 ft. crane runway.

One of the most essential requirements for profitable operation of jarring machines is efficient crane service. Nothing will "show up" the crane service like the presence of a good-sized jarring machine on the hand molding floor. Inefficient crane service in a hand molding foundry, of course, means idle time for the molder, but he will usually not make much of a row about that. When the jarring machine comes in, the foreman and manager are watching it, and delays caused by the crane are quickly noted. In properly operating the jarring machine, molds are set up on the floor, clamped, picked up by the crane, carried to the machine and rammed, picked up again and turned over, and then carried to the finishing floor by the crane. In connection with the machine just illustrated, we have found it profitable to instal 5-ton independent high speed auxiliary hoists on each of the two 60-foot travelling cranes in this foundry, as well as to instal a 2-ton electric jib crane and an 8-inch air hoist.

Fig. 13 shows a bronze casting mould for one of the twin beam air pumps of the battleship "Nevada." This mould was rammed on a 7 ft. x 10 ft. jarring machine in our foundry (in dry sand), and the metal was melted in a Schwartz direct-flame furnace. Government requirements were met with more than 50 per cent. to spare—the tensile strength was 46,000 lbs. per square inch, and the elongation 31 per cent. More than one week's labor was saved on this job alone by use of the jarring machine.

Fig. 14 shows a three-part pattern with stripping plate for the check piece of the mould, arranged for ramming on a jarring machine. It is for a cast iron tank with walls about ½ in. thick, and with feet cast on the tank. In view of the oft-repeated statement that copes cannot be made on the jarring machine, this three-part job with green sand core is of particular interest. It formerly required a day's labor for molder and helper to make this by hand, not counting the additional labor for a dry sand core. With this pattern, using the wooden stripping plate for withdrawing the pattern from the cheek piece and ramming all three parts on the jarring machine, the complete mold is now made in our foundry with less than two hours' labor.

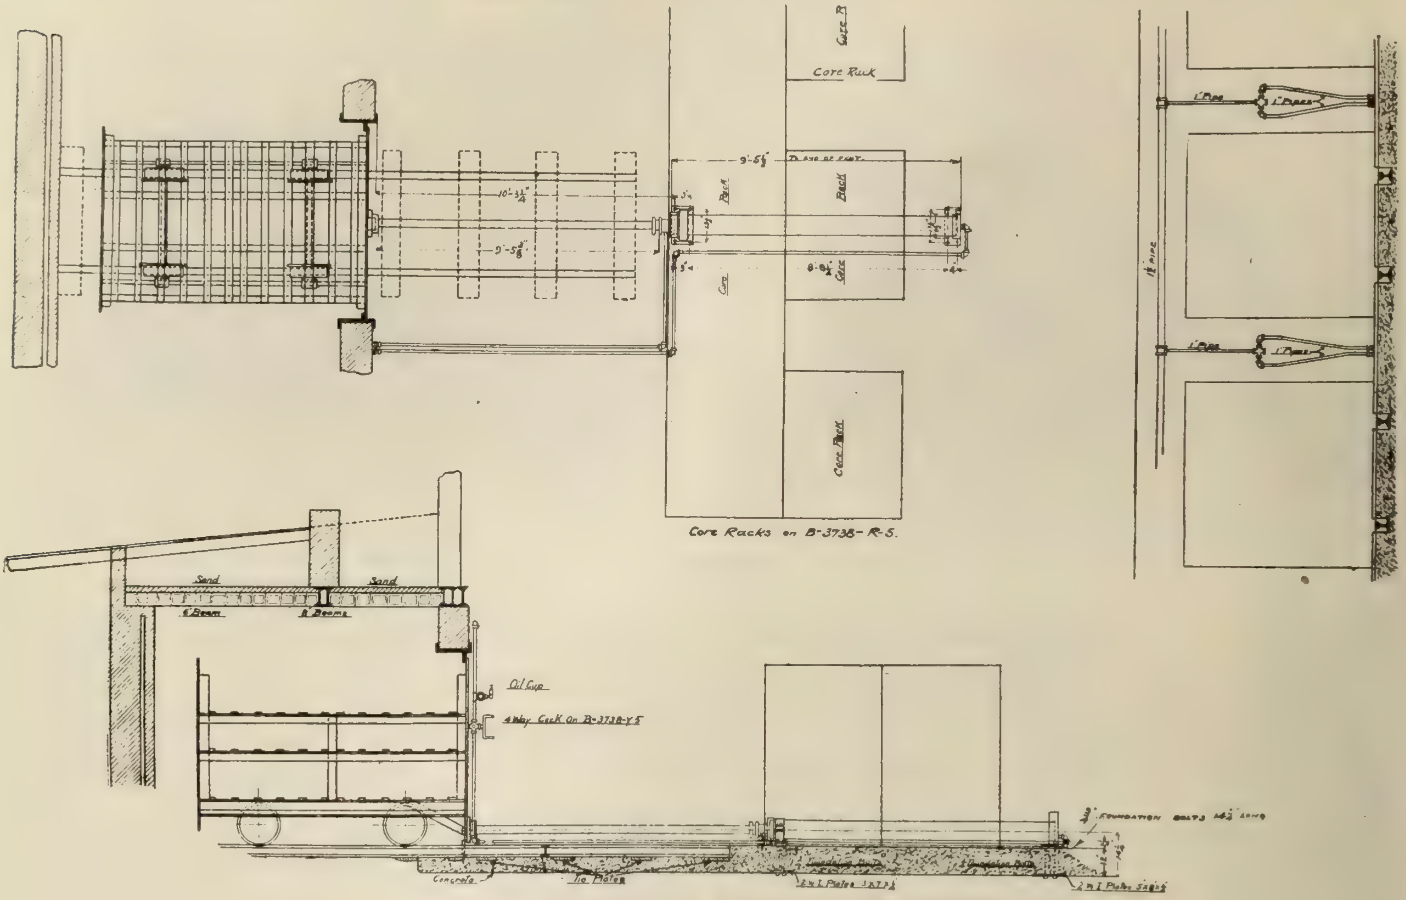

FIG. 10. COMPRESSED AIR CORE CARRIAGE HAULER.

Other Types of Molding Machines.

The jarring machine, though covering a wide range of work, is not a universal panacea for high costs and poor castings. For novelty work, the plain hand squeezer with vibrator attachment is widely used. For this same class of work the ramming is sometimes done by hand or on a plain squeezer, and the pattern drawn by a "sucker," Fig. 15 (background), with vibrator attachment. Fig. 15 shows a split pattern type of power squeezer, which is built by several Companies, and is very successful on small work. The photograph is of a part of the Blake-Knowles Machine Foundry. It is not my purpose to show views of all the molding machines on the market, but merely to point out that there is a wide variety of machines from which to choose, most of them designed for "hooking on to the compressor." The very fact that there are so many types of air operated molding machines only emphasizes the fact that compressed air is to the foundry what steam is to the power plant.

Pneumatic Rammers and Blow Guns.

While speaking of molding machines, I must not forget two very useful auxiliaries—the sand rammer and the blow-gun. Fig. 16 shows a pneumatic rammer finishing off the top of a cope rammed on the jarring machine. It is also a labor saver on ordinary floor work. It also shows a simple form of blow gun for cleaning out dirt from patterns and molds. In the background of the same picture is seen the simplest form of roll-over device for jar-rammed moulds—a spreader frame and flasks with trunnions. This simple device will be found preferable to the elaborate

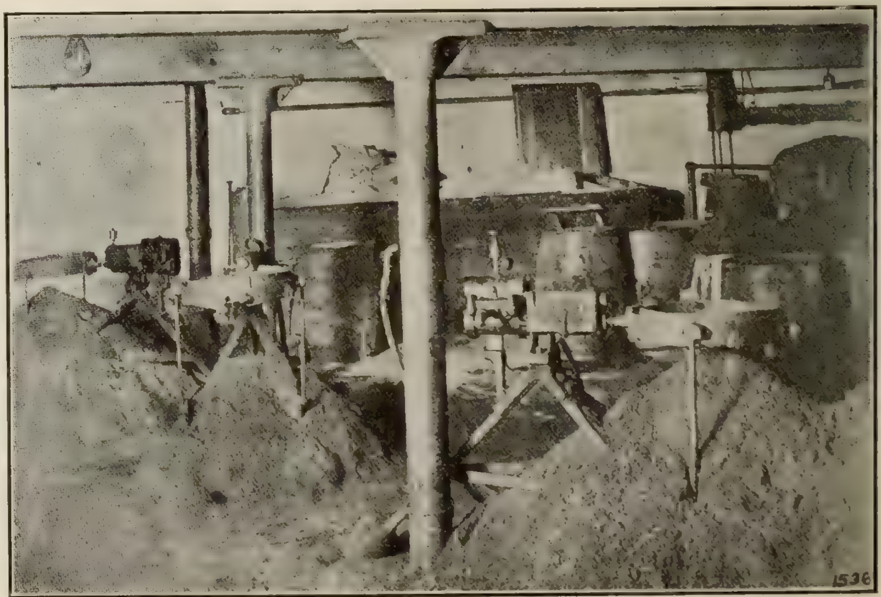

FIG. 11. PREPARING CORE SAND WITH PNEUMATIC RIDDLES.

roll-over attachments in the jobbing foundry. The special roll-over attachments, however, are very profitable in the specialty foundry where they are used for a long time on a single pattern.

We have now made the mold, set the cores and poured the casting, using air hoists and elevators for handling material, pneumatic riddles for preparing sand, oil and air fired ovens to bake the cores, pneumatic core machines to make the cores, and pneumatic molding machines. There now remains but to clean the casting, snag it and ship it, clean up the gangway and temper the sand for the next day's heat.

The subject of sand blasts is so broad that it can only be treated adequately in a separate paper, but the large number of sand blast appliances on the market are sufficient to indicate the extent to which these are applied to the cleaning of castings.

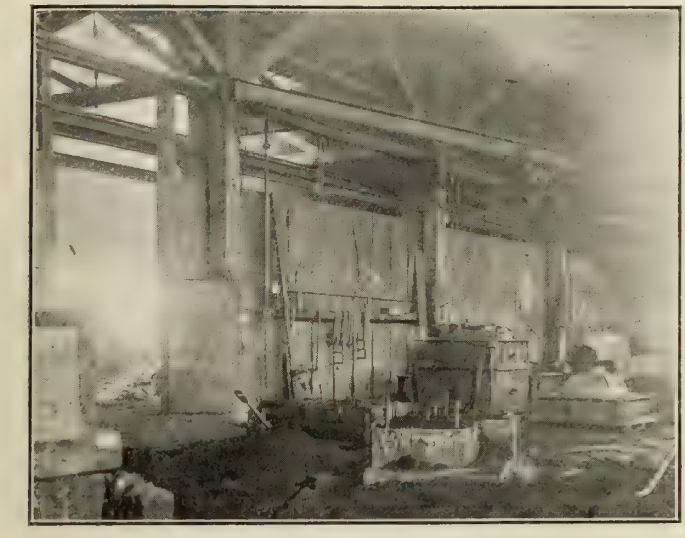

FIG. 12. JARRING MACHINE SET FLUSH WITH FLOOR. BLAKE & KNOWLES FOUNDRY.

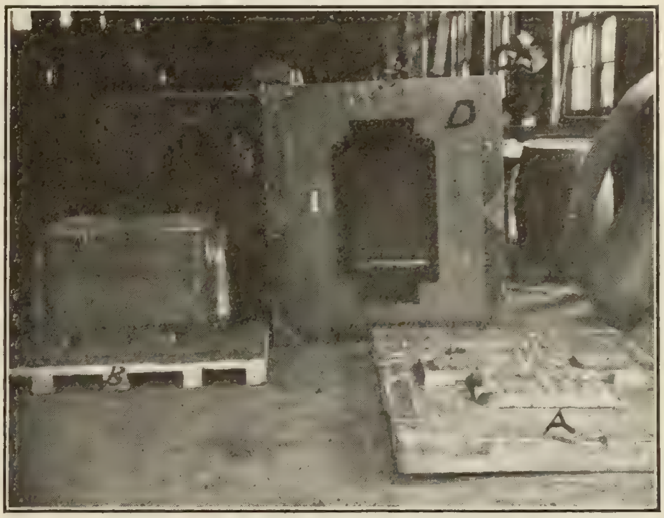

FIG. 14. PATTERN FOR 3 PART MOLDING OF TANK COPE (A), CHEEK (B), STRIPPING FLATE FOR CHEEK (C), DRAG OR NEWEL (D), MADE LIKE A CORE BOX. ALL RAMMED ON JARRING MACHINE.

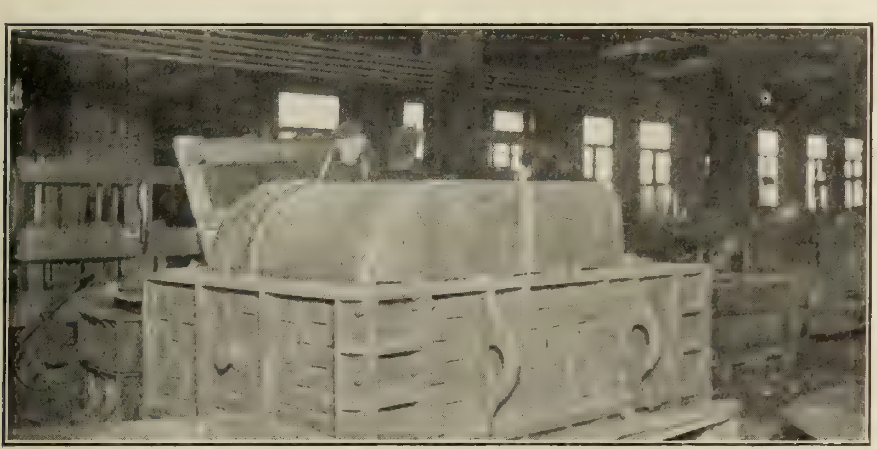

FIG. 13. MOLD FOR 40 IN. X 21 IN. TWIN CYLINDER OF 18½ X 40 X 21 TWINPLEX BEAM AIR PUMP FOR U.S. BATTLESHIP "NEVADA," SHOWING MOLD BEFORE CLOSING, WITH CORES SET. RAMMED ON JARRING MACHINE, POURED FROM SCHWARTZ MELTING FURNACE. GOVERNMENT BRONZE METAL, 88-10-2. TENSILE STRENGTH 46,000 LBS. ELONGATION, 31%. HEAT 9,000 LBS. CLEAN CASTING, 6,795 LBS.

Sand Blast Tumbling Barrels.

For cleaning small castings that are not fragile, there is no better method than the sand blast tumbling barrel. These are manufactured in a number of types. There are a number of machines built on the principle of a rotating barrel, with one or both heads stationary. A nozzle or nozzles from a regular sand blast machine is inserted through openings in these heads, and most of the machines operate on the low pressure system. Some return the sand to the machine by a suction system, and some by gravity, but all operate inside of an outer case closed by a sliding, swinging or rolling door, and connected to an exhaust system.

An efficient sand blast or sand blast tumbler, either of the high or low pressure type, will remove sand and scale, and leave castings better looking than either a plain rumbling machine or the emery brick, wire brush and pickling tank. Castings have been cleaned and their cores cut out in less than an hour

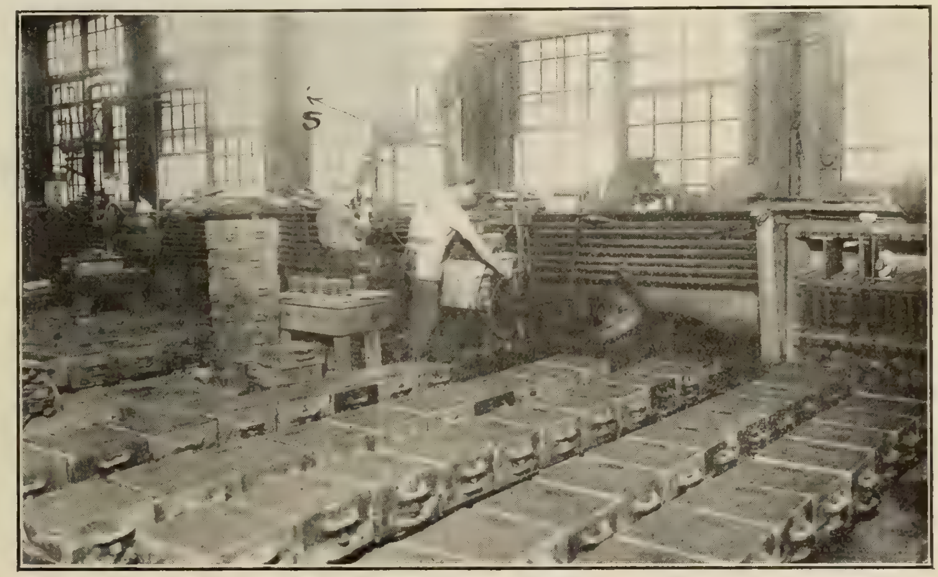

FIG. 15. SPLIT PATTERN SQUEEZERS AND "SUCKER" MOLDING MACHINES (5). BLAKE & KNOWLES FOUNDRY.

each with the sand blast that could not be cleaned by hand in two days. I know of one place where a sand blast tumbling barrel replaced a pickling tank, with the result that shipments could be made at least one day earlier than before. The product required galvanizing, and was sand-blasted and put in the galvanizing bath the day after it was cast instead of losing a day in the pickling vat.

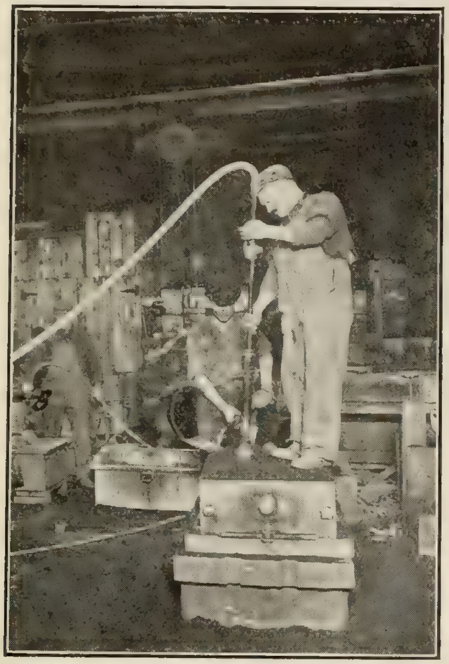

FIG. 16. SPREADER AND ROLL-OVER DEVICE (5), FOR PLAIN JARRING MACHINES, BLOWGUNS (B), CLEANING MOLDS BEFORE CLOSING.

Chipping Hammers.

The casting now being clean, the fins, etc., are chipped off with a pneumatic chipping hammer. One man chipping with a chipping hammer is as good as two or three with hand chisel and sledge, and the work looks better and smoother. A skilled chipper will quickly remove fins or bunches, so that they appear scarcely to have existed.

Care of Pneumatic Tools.

Before attaching a tool, blow out the air line and squirt oil into the valve. Do not use an air hammer all day long without oiling it. If the hammer has not been used for some time, squirt a little kerosene or benzine into it, connect up the hose, operate the machine for a few strokes, then disconnect and squirt a light machine or sewing machine oil into the hammer. Several of the large oil refiners now supply a special pneumatic tool oil which should be used if possible.

New hammers are always furnished with a gauze strainer, and this should be kept in good condition, as rubber particles and rust from hose and pipes are liable to clog valve passages if allowed to get into hammers. It is a good plan to suspend the hammers over night in a bath of kerosene to clean them out and to prevent rusting from moisture in the air. They must then surely be lubricated before using, as the kerosene leaves them dry.

There are a number of makes of automatic oilers on the market to be attached to the air line a few feet from the hammer. If none of these are used, the hammer should be oiled several times a day. Chisels should be kept in shape, and, in general, the hammer should be treated as if it were a piece of machinery rather than a piece of scrap iron.

Sand Riddles.

We now have only to cut the sand for the next day's work to bring us back to our starting point. Fig. 17 shows a large-sized pneumatic sand riddle cutting sand for the main floor or cleaning up the gangway. This machine will handle all the sand that four or five laborers can shovel into it, and makes quick work of this job. Fig. 18 shows a smaller machine of the round riddle type, located between two split pattern machines in a machine foundry. The sand for these two floors is cut by the molders themselves.

In discussing compressed air in the foundry, one could easily digress in many directions, for compressed air is so thoroughly applied in the up-to-date foundry that a discussion of its use is a discussion of modern foundry practice. It has been my intention simply to set you thinking of places where compressed air would save money in your foundry, and to discussing the statements made, whether you agree with them or not. If I have done this, the purpose of this paper will have been accomplished.

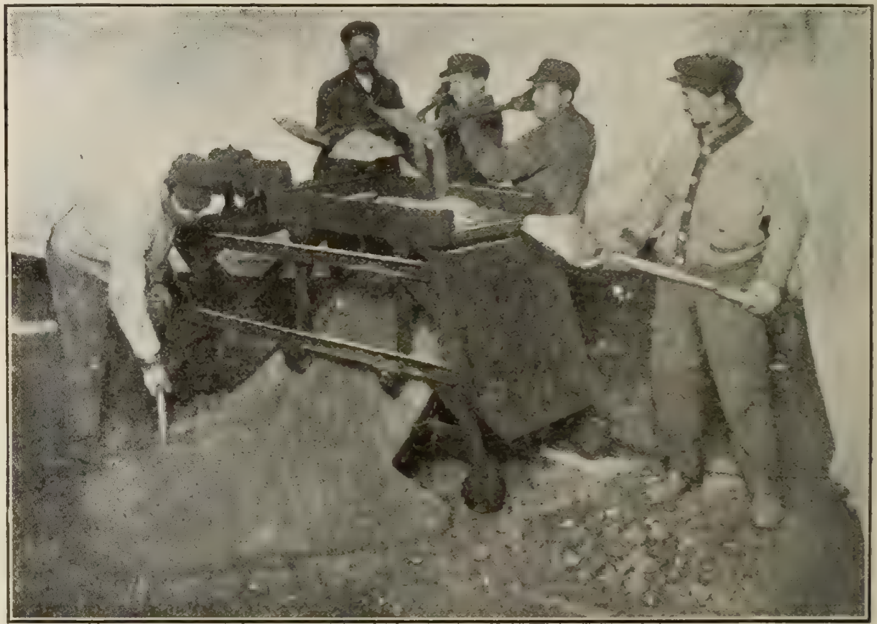

FIG. 17. PNEUMATIC SAND RIDDLE, RECTANGULAR TYPE.

FATAL BOILER EXPLOSION.

TWO dead and three injured is the result of a boiler explosion which took place at the sawmill of Mr. Manley Chew shortly before eight o'clock on the morning of October 21. The mill had been running about three-quarters of an hour when the accident occurred.

The engineer was in the engine-room at the time, and escaped injury, as also did the fireman, who was in the fuel-house. Harry Sager, one of the killed, was assisting to fire the boiler, and is believed to have been blown through the brick wall, as he was picked up outside of the heap of debris. He was injured in a terrible manner. He was fifty-six years of age, and leaves a wife and family of two sons and five daughters. The other victim was a boy named Freddie Fraser, about eighteen years of age. He was standing at the boiler-room door, and was completely buried in the brick and other material. John Dwindle was the most seriously injured of the three who escaped with their lives. It was thought he could not recover, but the physician has good hopes of pulling him through.

The boiler-room was a building about 130 by 40 feet, built of brick, none of which is left standing. The boilers were four in number, and apparently the middle one of the three, the largest, was the one to cause the trouble. The boilers with a capacity of about 150 horse-power were thrown about 25 feet and piled one on top of the other. Brick and pieces of the roof were thrown hundreds of feet. The lath mill and picket mill, which are attached to the main mill, were badly wrecked.

Drill Jig and Fixture Design and Construction

By H. R.

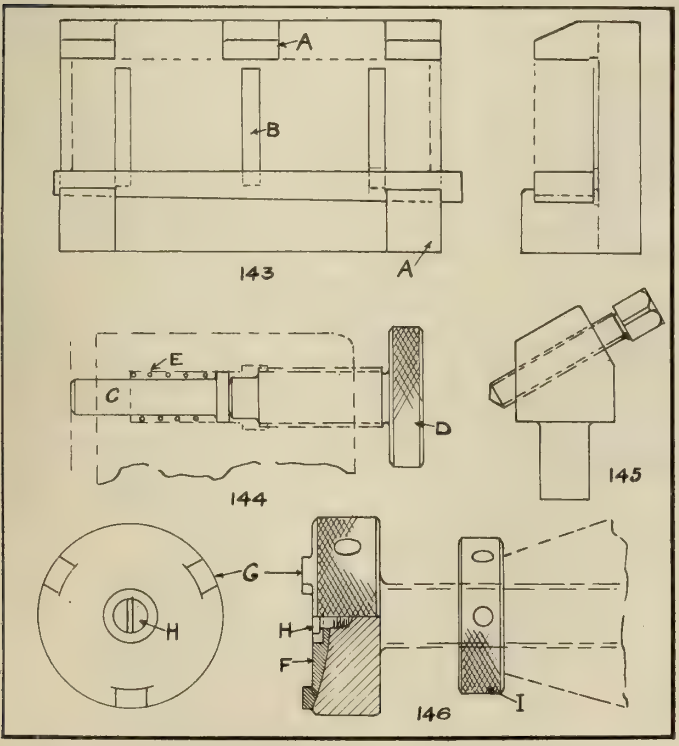
The sketches and data will, the writer hopes, appeal to machine shop superintendents, designers, toolmakers, and novices, as indicating the large place jigs of every kind and for every service occupy to-day in machine shop practice.

IN the design of jigs for small components, it is well to consider if more than one piece can be drilled at one time. By making the locating pins longer, and if there is a locating wall, this can be made higher, and the legs of the jig can be made longer.

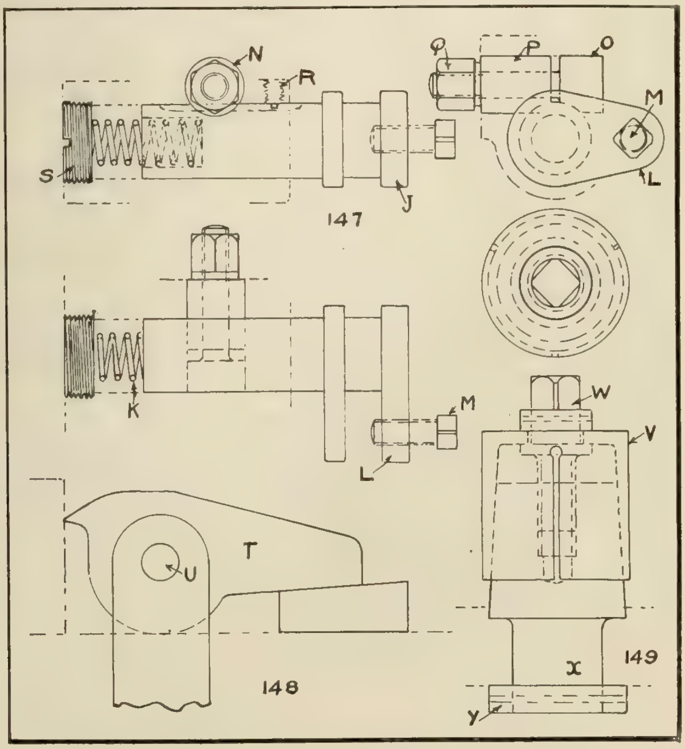
There are other ways of setting up two or more components in one jig to advantage, such as placing them side by side, and perhaps one strap with the adoption of a number of screws will be sufficient for drilling more than one piece.

Sometimes work can be located in a jig to advantage by a wedge knocked into place. An idea is illustrated by Fig. 143 in which two lugs are cast and machined to suit the wedge. These take the full thrust with the top lugs (A). In jigs of this sort a large amount of machining may be saved by simply having strips for machining purposes, as shown at (B). Fig. 144 shows a good way of screwing on to a piece that it is otherwise impossible to get close to for the purpose of clamping. The arrangement consists of a round piece (C), out of which is formed a shoulder. The screw (D) operates against the piece (C), and it will be readily seen that the coiled spring (E) always holds the piece (C) against the end of the screw, either when same is screwed forward or reversed. Many ways of clamping work have been shown which can be adopted for drill jigs as well as other jigs and fixtures. The pointed screw, as shown in Fig. 145, is a good method of clamping work on planing machines, milling machines, etc. The screw set at an angle, as shown in Fig. 145, not only presses the work on the table of the machine, but pushes it up to the other stop.

Fig. 146 shows a clamping method for the backing up of irregular work. This irregularity is taken care of by the spherical piece (F), which, when the screw is adjusted, the end being spherical, finds a level bearing. This is made with three pieces or projections (G), and is held by the screw (H). After this is adjusted to its correct position on the work, it is locked by the nut (I). A very uncommon method of clamping work is shown in Fig 147. In some pieces, it is almost impossible to find a suitable way of holding. Although an expensive arrangement, the one shown should find favor among designers of jigs. It consists of a formed piece (J), which is turned to suit a hole to accommodate it, and is bored for the coiled spring (K), the work being held between the two lugs (L) by the set screw (M). This arrangement is especially adapted for supporting the long end of a lever, so that the other end to that which is held between the lugs (L) is the main clamping portion, and the arrangement shown in Fig. 147 automatically adjusts itself by means of the spring (K). When the work is adjusted, the piece (J) is locked up by means of the wedge arrangement (N). This consists of a bolt (O) and a collar (P). By tightening the nut (Q) it will be readily seen that the piece (J) is held securely, as the screw (R) prevents the piece (J) from coming out of its bearing by working in a slot, and the compression of the spring can be regulated by the plug (S). Fig 148 shows what is called a gripping dog. The base of the dog is slotted to receive the jaw (T), which fulcrums on a cross pin (U); a wedge is inserted under the end of the tail dog, and by hammering this inward the jaw is caused to grip both inward and downward at the same time. This will firmly hold the casting down on the table of the machine as well as gripping it. Of course, this tail can be drilled and threaded to take an adjusting screw if desired. Fig. 149 depicts a way of clamping down work by an expanding bushing. The hole into which this operates is bored first. The arrangement consists of a split bushing (V), which is saw cut in three places and shouldered on the top portion, so that the vertical movement can be controlled by the operating screw (W). The collar is pegged into place after the



DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.



DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.

bushing is slipped over the screw. It will be seen that the vertical movement of the bushing is entirely mechanical, no springs being used, as in some cases. By the adjustment of the screw, the bushing is moved downward or vertically at will. It works on the stud (X), which has a taper portion for expanding the bushing as it is screwed down. This is fitted into the necessary fixture, and is held securely in place by the collar (Y), which is pegged on to the stud (X).

*

PROFIT SHARING AMONG EMPLOYEES.

THE proposal by a New York mercantile house for participation financially by its employes in the operations of the house, and a further step in this direction by the Youngstown Sheet & Tube Co., both announced within the last few days mark the latest adoptions by large companies of this practice which has become so general among industrial corporations in the past decade.

The United States Steel Corporation was a pioneer among the prominent industrials to initiate profit-sharing on a wide scale for its employes. The finance committee of the company selected the method of stock-subscription in 1902, and allowed its 55,000 (at that time) employes to acquire preferred stock at a price somewhat under the current quotations. Beginning with 1909, and in following years, the common stock of the corporation has been very successful.

Seeking Continuous Service.

The International Harvester Co., the Republic Iron & Steel Co., the United States Rubber Co., the National Biscuit Co., and the E. I. du Pont de Nemours Powder Co., are among the big concerns which have put in force plans more or less resembling that of the Steel Corporation.

In several cases, in order to induce employes to continue as shareholders in the company after they have subscribed, extra payments have been made annually if the holders have been continuous employes of the company and have given satisfactory service. For example, in the 1911 offering to United States Steel Corporation employes, when the preferred stock was sold at $114 and the common at $70, it was provided that on exhibiting a certificate that he had "been continuously in the employ of the corporation and had shown a proper interest in its welfare and progress," the stock-holding employes would receive a payment of $5 per annum per share of preferred and $3.50 per share of common. With similar restrictions the International Harvester Co. allowed a special payment of $4 per share of preferred and $3 per share of common.

Pensions and Bonuses.

Among the companies which have established comprehensive pension and accident policies, including voluntary and permanent disability reliefs, are the International Harvester Co., Youngstown Sheet & Tube, du Pont de Nemours Powder Co., American Sugar, Consolidated Gas, Philadelphia Rapid Transit, and Brooklyn Union Gas. In many cases bonuses have been given employes, the bonus taking various forms, from an outright lump sum as Eastman Kodak distributed, to a graduated percentage of salary after certain years service as was put in force by Sears-Roebuck.

The distribution of large cash bonuses in lump sums has been found impracticable by the Youngstown Sheet & Tube Co., and other companies whose labor is in large part foreign, as it has been the case in the past that numbers of the employes returned to their native countries on receipt of their share.

Many of the railroad companies have comprehensive pension plans in force, and, in years past, several have attempted stock distribution schemes, but with little success, on account of the comparatively low income yield of the securities.

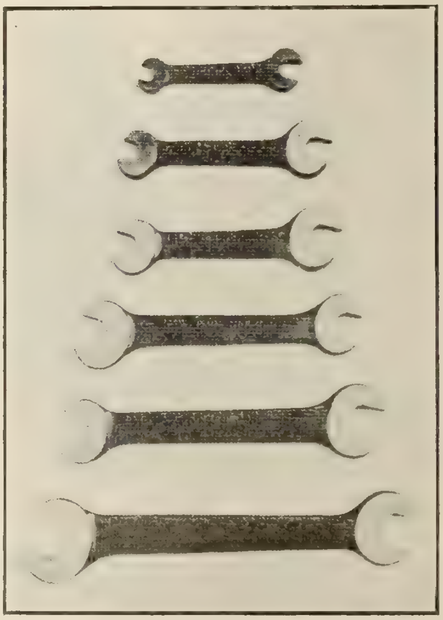
BLACK LACQUER ON STEEL TOOLS.

BLACK lacquer, says the "Brass World," has come into quite extensive use within the past few years and has proved to be a very serviceable material for many classes of work. It produces a black finish that is quite durable and exceptionally pleasing in appearance.



STEEL WRENCHES WITH BLACK LACQUER FINISH.

One of the recent applications of this material is in finishing of steel tools, such as the wrenches herewith illustrated. Previous to the use of this black lacquer, it was customary to leave the wrenches with a case-hardened surface or an oil black surface, both of which are more expensive to produce than the one obtained by the use of black lacquer. To be sure, the oil or case-hardened finishes are still used. The lacquer may be applied to the article after the forging has been made and the necessary machine work has been done upon it. The brush is the best method of applying the lacquer.

Tools finished in this manner have a very attractive appearance, and the lacquer is quite durable, as, after they have been put into use oil has no effect upon it.

*

FLAME TEMPERATURE IN LOCOMOTIVE FIRE-BOX.

INASMUCH as the efficiency of a locomotive increases as the degree of superheat rises, states the Railway Gazette, it can readily be seen that the flame temperature in the fire-box is a very important factor, and it is quite necessary that the draught appliances be so constructed as to produce an even, steady pull over the entire grate, and a draught condition that will make the engine steam freely. In order to obtain this it is usually necessary to employ a somewhat smaller nozzle, blast pipe, and chimney arrangement. On account of the smaller volume of exhaust steam and its higher velocity a moderate reduction in the size of the exhaust nozzle does not produce the same bad effect as with saturated steam, and its reduction to produce the desired draught conditions may be reached before there is any notice of the effect in the way of back pressure.

However, the necessity for these changes depends much on the quality of fuel and the operating conditions. It is indispensable that the firing should be light and regular, and a high flame temperature maintained, whilst banked fires and the application of fuel in large quantities should be avoided, as this practice produces a low flame temperature which materially reduces the degree of superheat, and affects the economy and efficiency of the locomotive. Experience has shown that a very bad condition of affairs can exist in the front end of a superheater locomotive, and still the performance be reasonably satisfactory.

Commissioner Harris, Toronto's city engineer, will start a technical library of 900 volumes for the benefit of the mechanics and employes of the Works Department.

MACHINE SHOP METHODS AND DEVICES

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

MACHINING C. I. BALL RINGS.

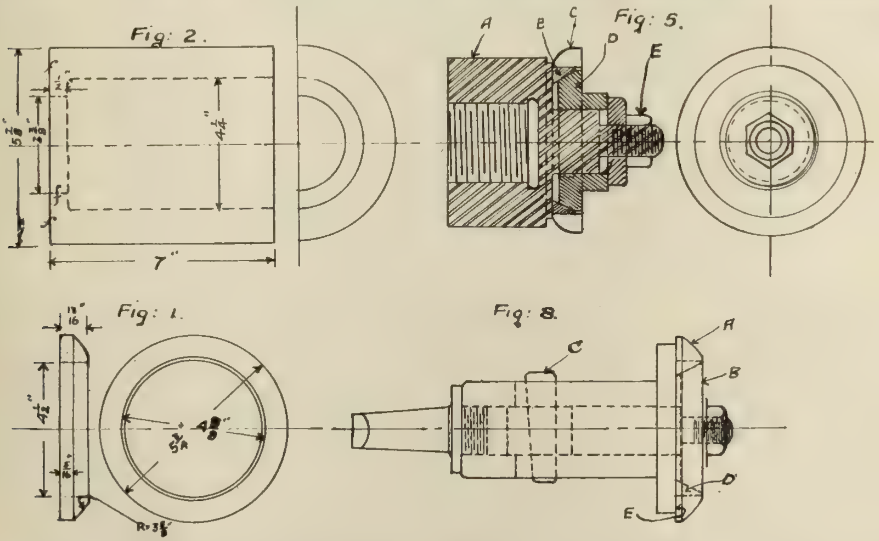
By. Geo. Black.

THERE are a number of ways of producing cast iron ball rings, the method employed depending upon the diameter of the ring, whether it is to be finished all over, whether it is to have a radius at both ends or at one end only, and whether both ends require a ground joint. The methods and fixtures herewith described are particularly adapted to that type of ball ring which requires to be finished all over, with a ground joint at each end, as shown in Fig. 1. These rings are machined from a cylindrical casting, Fig. 2, from each of which six rings are obtained, leaving about ⅝ inch of the casting to be scrapped.

First Operation.

The first operation is to face, bore and thread the casting where marked "f." The turret lathe which handles this work in the shop with which the writer is connected is shown in Fig. 3. The casting is held in a four-jaw chuck, but a two-jaw box chuck gives even better results. The cross slide carries the facing tool and works outwards from the centre, while the turret is boring the hole ready for tapping. The turret is then re-set and the hole tapped. The detail operations and times are:—

	Rev. per Min.	Feet per Min.	Depth of Cut.	Feed per Rev.	Time, Minutes.
Face	32	50	3-32 inch	.02 inch	3.0
Chuck and true up					1.5
Set cross slide tool and cut					0.5
Set turret tool and cut		These operations are performed while casting is being faced off.			
Bore for threading (two cuts)					
Re-set turret tool					
Tap hole	12	18		Hand	2.0
Re-set cross slide, and change speed					0.5
Re-set tool. Remove work					1.0
Total time in minutes					8.5



FIGS. 1, 2, 5, 8. MACHINING CAST IRON BALL RINGS.

The casting next passes to a LeBlond 21-inch heavy duty turret lathe which has been specially tooled up for this work and gives excellent results. Fig. 4 illustrates the method of chucking the casting for this operation. It is very economical, as it enables the whole of the casting to be cut up into rings except the last ⅝ inch. The half tone also shows the tools used in this operation.

The combined turning and boring toolholder is seen at (A), it having been removed from the turret in order to show it more clearly.

At (B) is seen the tool-holder which carries the two parting-off tools (b,b), one of which operates from the outside of the casting, while the other operates in the bore and thus reduces the time of parting-off by one-half, at the same time distributing the work over two tools, and thereby prolonging the time between grindings.

The ball or radius, is formed by two sweeping tools, one of which is seen at (C). This tool roughs out the radius, while the other not seen in the turret, is reserved for a light finishing cut. The detail operations for this stage of the work are:—

		Rev. per Min.	Ft. per Min.	Depth of Cut.	Feed per Rev.	Time, Minutes.
(1)	Screwing casting on adapter	..	..	......	....	0.75
(2)	Re-set tool and cut	..	..	......	....	0.5
(3)	Rough turn and bore	32	52	⅛ in.	.031	7.00
(4)	Re-set tool and cut	..	..	......	....	0.5
(5)	Rough face end	32	52	⅛ in.	.031	0.5
(6)	Re-set tool and cut. Change speed	..	..	......	....	0.5
(7)	Rough ball	20	33	1-16 in.	Hand	1.5
(8)	Re-set tool	..	..	......	....	0.25
(9)	Finish ball	20	33	1-32 in.	Hand	1.25
(10)	Re-set tool and cut	..	..	......	....	2.5
(11)	Part-off ring	20	33	1-16 in.	Hand (.007)	2.0
(12)	Repeat items No. 6 to 11, inclusive, for five other rings	..	..	......	....	30.0
(13)	Remove scrap casting	..	..	......	....	0.5
	Total minutes for six rings					47.75
	Total minutes for one ring					7.95

Flat Sides Finish Turned.

The ring is now ready to have the flat sides finish turned, and, for that purpose, passes to an engine lathe fitted with a device for holding it securely without distortion. The arrangement, which is shown in Fig. 5, materially reduces the time of chucking. The body of the adapter is seen at (A), (B) is the split ring, (C) the ball ring in position, and (D) the expanding cone. Tightening up the nut (E) expands the split ring into the ball ring, holding it firmly, yet without undue stress.

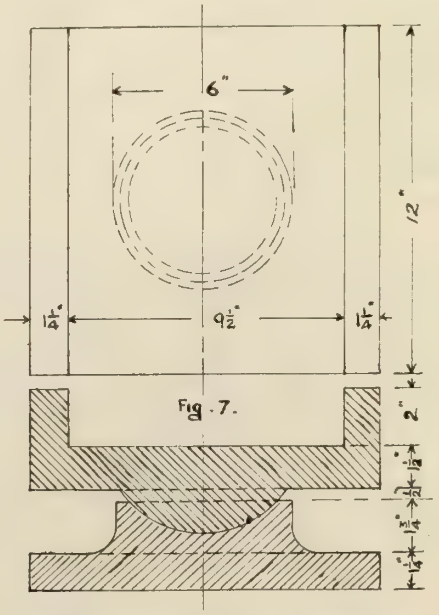


FIG. 7. MACHINING CAST IRON BALL RINGS.

The detail operations on this work are:—

	Rev. per M.	Ft. per Min.	Depth of Cut.	Feed per Rev.	Time, Minutes.
Chuck					.25
Face	45	65	1-32 in.	.007 in.	2.25
Remove					.25
Total time in minutes					2.75

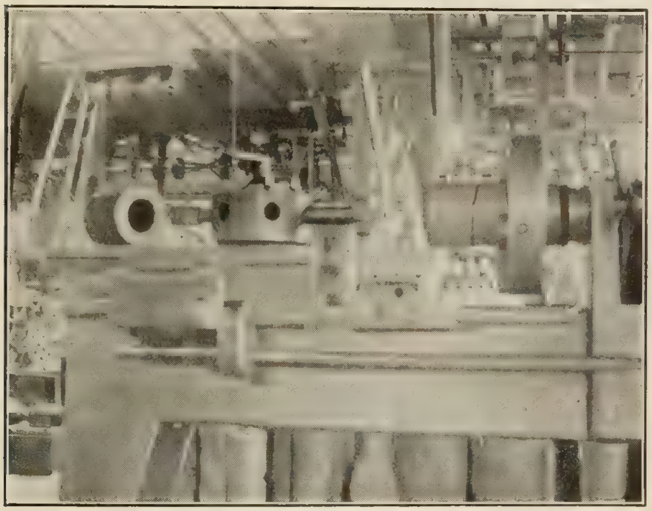

FIG. 3. MACHINING CAST IRON BALL RINGS.

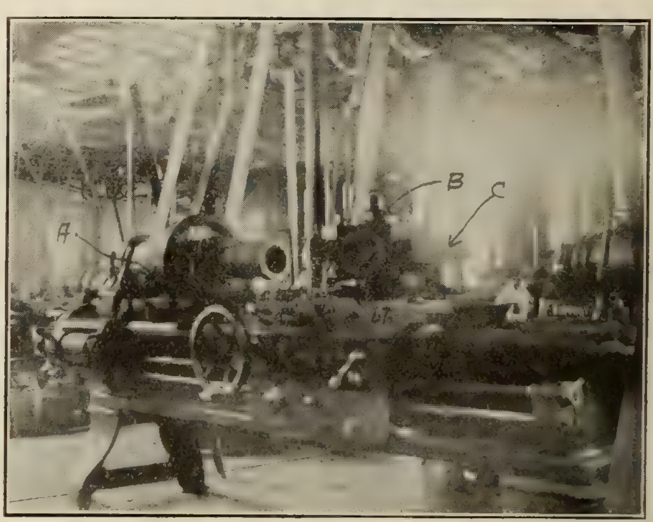

FIG. 4. MACHINING CAST IRON BALL RINGS.

Grinding Ball Ring Into Seat.

The next operation is that of grinding the ball ring into its seat, which in this case is the gland seen at (A) in Fig. 6. The work is handled on an old drill press which adjoins the lathe used for the previous operation. The device shown in Fig. 7 is used for grinding in the ball joint. It may also be seen at (A) and "B" in Fig. 6. Its utility is obvious, ensuring, as it does a perfectly spherical ball joint free from grooves. The ball ring is held and driven by a device similar to that used for the finish turning of the flat side of the ring. It is shown on Fig. 8, from which it will be noticed that in this case the expanding cone (B) is drawn into the split ring (D) by the taper cotter (C), the ball ring (A) truing itself up against the shoulder (E).

These attachments make a splendid combination for turning out accurately ground ball rings, the average time taken in minutes being:—

Chuck ring and place gland	.5
Grind ring to gland	5.0
Clean, remove ring and gland	.5
Total time in minutes	6.0

Grinding Flat Side of Ring to Seat.

There now remains the flat side of the ring to be ground to its seat, and Fig. 9 illustrates how an old lathe head-stock was rigged up to take care of this work. The piece upon which the ball ring seats is seen in the chuck, while the ring is held upon a wooden taper plug furnished with a cross handle. This may be seen in Fig. 9 at (A). The handle enables the operator to apply the pressure evenly, and control the ring during the grinding operation.

The average time in minutes for this part of the work is:—

Chuck ball ring seat	.25
Grind ring to seat	3.00
Clean and remove	0.50
Total time in minutes	3.75

Summary of Operations.

The above arrangement is handy, turns out good work and has the additional advantage of being rigged up cheaply. A summary of the foregoing operations will show that the total machine time upon the ball ring shown in Fig. 1 amounts to:—

1st operation, face and thread	8.5
2nd operation, turn, bore, ball and part off	7.95
3rd operation, finish face flat side	2.75
4th operation, grind ball joint to seat..	6.00
5th operation, grind flat side to seat	3.75
Total time in minutes	29.00

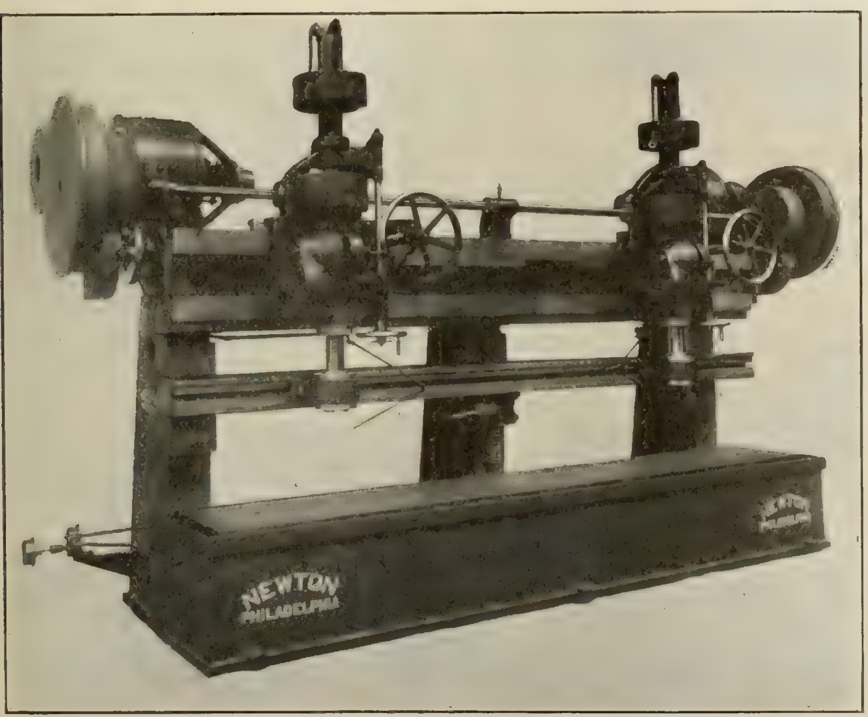
DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

DUPLEX LOCOMOTIVE ROD BORING MACHINE.

OUR illustration shows a modernized design of the Duplex Locomotive Rod Boring Machine built by the Newton Machine Tool Works, Philadelphia, Pa., in which particular pains have been taken to protect fully all exposed gears for the safety of operators, and to make the equipment adaptable to a large line of work not heretofore covered, including the boring of boxes, brasses, etc., and the turning of oil cups from the solid. Motion for the drive from the two 10 H.P. General Electric, RLC-116, 400 to 1200 R.P.M. motors, direct, gives spindle speeds from 12 to 36 R.P.M., and through back gears, gives spindle speeds from 40 to 120 R.P.M.

Each motor is operated independently with push button control. The guide bearing rail and the guide bearings which are adjustable in vertical and horizontal directions respectively, securely support the ends of the spindle. The spindle has hand slow and hand fast, vertical adjustment, three changes of gear feed, horizontal adjustment on the rail by hand, and provision for securely locking the saddle in any desired position. Lubrication is by gravity from the storage tank inside the cross rail, while provision is made for draining to additional storage tanks in the table, and the lubricant is transferred from table to rail by gear pump. This machine is capable of boring the largest rods with centre distances between bores of 30 in. to 11 ft.



DUPLEX LOCOMOTIVE ROD BORING MACHINE.

◆

SYNCHRONOUS FREQUENCY CHANGER SETS.

MANY operating conditions require the conversion of electrical energy from one frequency to another, and an economical and efficient means of accomplishing this is by means of frequency changers. Some of the special features of these Westinghouse Electric sets are that their design embodies space economy. They are self-starting, and the stators of both motor and generator are mounted on a common bedplate, being as close together as mechanical clearance and ventilation requirements will permit. The rotating parts of both machines are mounted on a common shaft. A pedestal bearing is ordinarily mounted on a "bridge," as illustrated in Fig. 3, and in case of repairs, this bridge can be quickly removed and the stator easily slid to one side along the bedplate, to allow ready access to either stator or rotor.

If conditions require two or more synchronous sets to operate in parallel, the rotors of all generators must bear the same phase relationship on their respective shafts. It is not practical to set these rotors with sufficient accuracy during the process of manufacture. One stator is, therefore, set in a "cradle," which permits of sufficient rotation to obtain a proper alignment, as illustrated in Fig. 2. This adjustment has to be made only when starting up the sets for the first time, and thereafter their relative locations do not change.

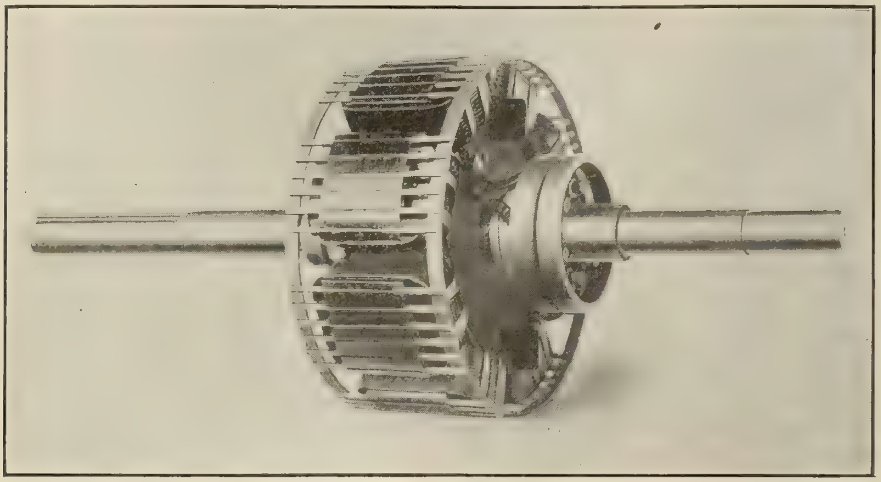
The stationary frames are made of strong, rigid iron castings, into which soft steel laminations are dovetailed and securely fastened. Ventilating ducts are spaced at frequent intervals across the face of the armature punchings. The armature coils are vacuum dried and impregnated before the outside insulation, consisting of wrappings of mica and paper on the straight portions of the coils which lie in the slots, and servings of treated cloth over the V-shaped coil ends is applied.

A rugged spider is used, to which field poles, built of thin steel laminations riveted together, are either bolted or dovetailed, as required by the speed of set. These poles have overhung tips provided to support the field poles, which are built up of heavy copper strap wound on edge, and insulated in such a manner that the individual turns are each exposed to the air for ventilation. The bearings of these standard frequency changers are self-oiling and built of cast iron shells of ample size, split horizontally to allow ready removal, and lined with grooved babbitt. They are fitted with oil rings, which carry the oil from a well in the bottom of the shell to the shaft. The shaft is provided with oil-throwers and catchers. Covered openings in the upper shell facilitate inspection of the oil rings.

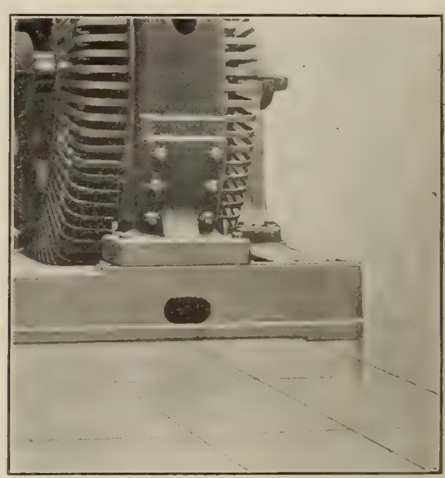
The selection of a set to be used for each installation is worthy of careful consideration. A high-speed set is generally somewhat cheaper than a low-speed one, but may not give the exact frequency ratio required. The synchronous type has certain advantages which render it the almost invariable choice, but there may be cases where an induction set would be preferable. The synchronous set is slightly more efficient. It permits of operation of the motor at unity power factor, its point of highest efficiency, or by slightly increasing the capacity, at a leading power factor, and thus obtaining a corrective effect which is often desirable. The synchronous set can at slightly increased expense be made reversible.

The synchronous set is at a disadvantage when of relatively small capacity and required to tie two much larger generating systems together. In this case, the speed of one system must always have the same relation to the speed of the other system, and any change on one must be transmitted through the set, and the frequency changer supply the power necessary to bring the speed of the other system to its corresponding value—enabling heavy overloads to be imposed on the set. Here the induction outfit, with some variation in slip possible, may be the proper machine.

A direct-connected exciter can be supplied, mounted on either motor or generator end of the set, and of capacity to furnish either motor or generator, or both, with the necessary excitation. When variable loads are likely to be encountered, and an automatic regulator is used, separate exciters for motors and generator are usually preferable, inasmuch as a common exciter would necessitate constant attention in order to control the power factor of the motor. All sets are carefully inspected during each step in the process of manufacture and before each succeeding operation is started. When completed they are tested under conditions as nearly identical as possible to those which future service will demand.



SYNCHRONOUS FREQUENCY CHANGER SET DETAIL.



SYNCHRONOUS FREQUENCY CHANGER SET DETAIL.

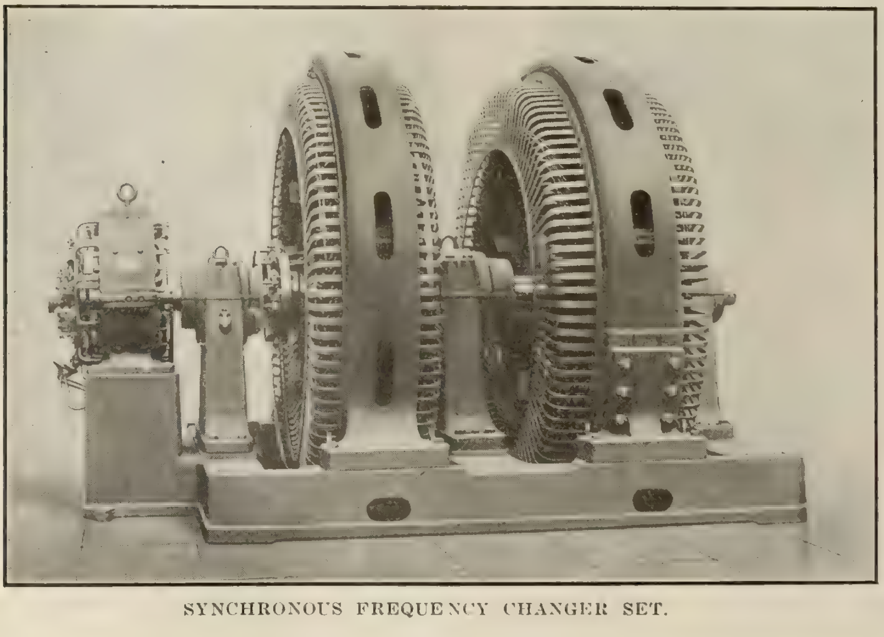
THE ROBB CORLISS ENGINE.

THOSE who have wanted to profit from the economy of a Corliss engine but have hesitated to install this type because its speed is too low, especially for driving a generator direct-connected, may be interested in the Robb Corliss engine. With shorter stroke, much higher speed, positive operation of valves, and complete enclosure of moving parts this type overcomes many objections to the old forms of the well-known Corliss engine, yet at no sacrifice to the usual advantages of this valve gear—almost perfect steam distribution, independent adjustment of the events of the stroke, small clearance, and separate cylinder ports for admission and exhaust which reduce cylinder condensation.

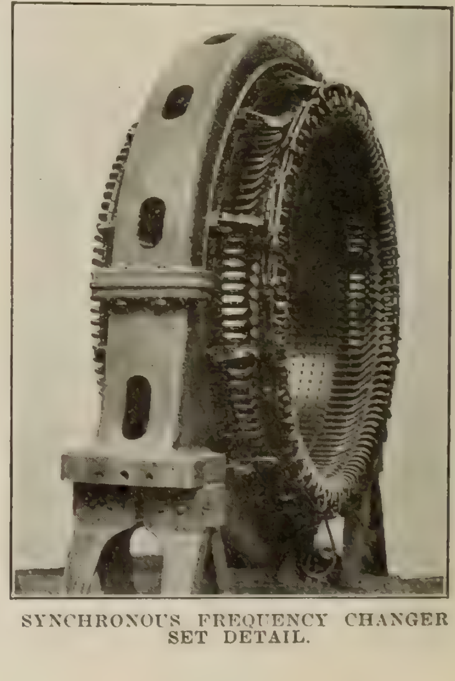
Speed.

Successful operation at speeds from 90 to 225 revolutions per minute is claimed to be the principal advantage resulting from the modified Corliss valve gear as used in the Robb engine. This high speed is made possible by simplifying the valve gear so as to eliminate all springs, dash pots, latches, cams, and disengaging parts.

In addition to the higher speed, the absence of these delicate parts means a smooth running engine, and so little wear on the valve gear that steam economy and good regulation are maintained indefinitely. The economy does not fall off rapidly after a short period of operation because the valve is not under the strain caused by the continual lifting of dash pots; and the valves cover the ports so

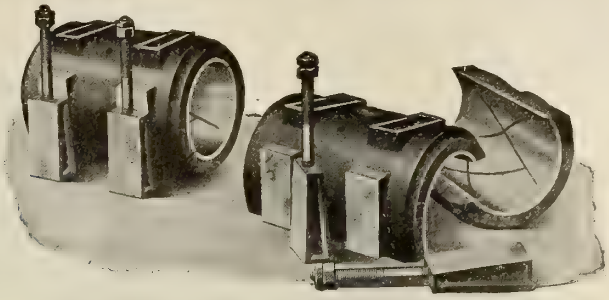


SYNCHRONOUS FREQUENCY CHANGER SET.



SYNCHRONOUS FREQUENCY CHANGER SET DETAIL.

firmly and seal them so tightly that there is no chance for leakage.



MAIN BEARINGS, ROBB CORLISS ENGINE.

In other respects the Robb Corliss type is designed on the lines of modern heavy-duty Corliss engines.

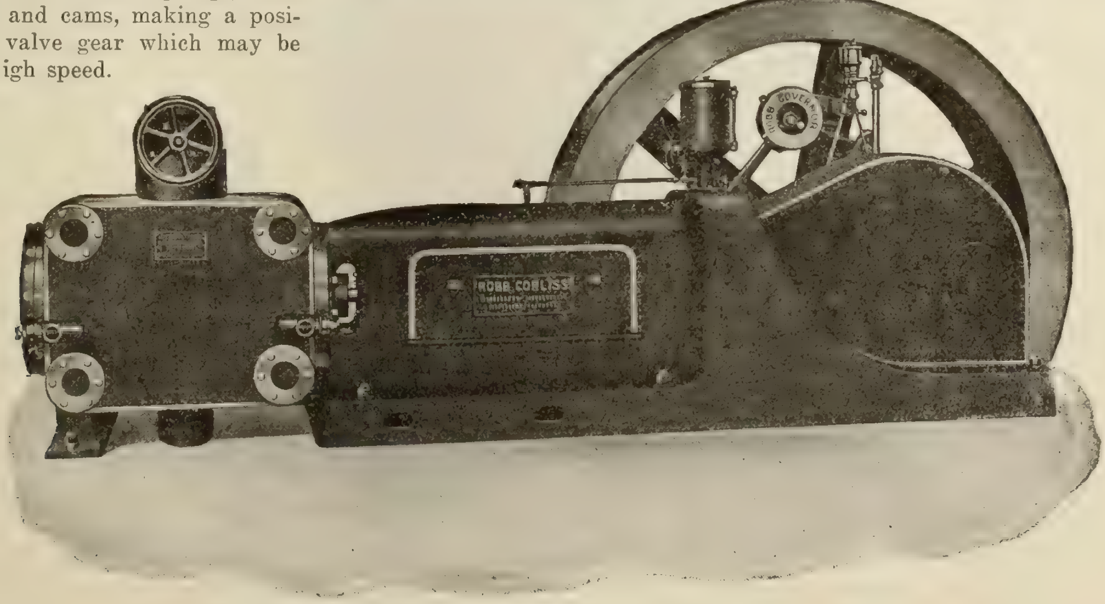
Valves.

Full pressure of steam gets quickly into the cylinder of the Robb engine because of the triple port opening through the admission valves; and there is free exit through the exhaust valves at the proper time because of the double port opening. The steam pressure is well taken care of by the large surfaces of the valves which are nearly balanced by carrying the metal around the top, resulting in long life and minimum wear of valves and seats.

Accurate machining of the ports is possible because the valve seats are separate bushes, machined before being put in place.

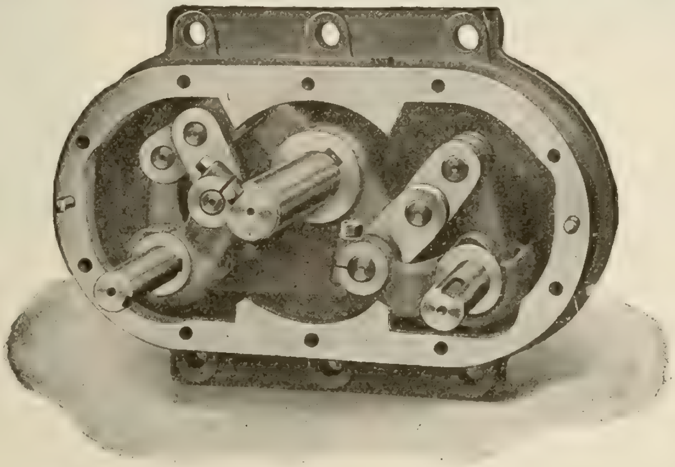
Valve Gear.

A valve action that does not depend upon a releasing gear for quick opening and closing is a distinct feature of the Robb Corliss engine, yet the motion imparted to the valves is identical with that of drop-cut-off gears which pick up the lifting arms, and then drop them. Two small links between the wrist plate and bell crank do away with springs, dash pots, latches, and cams, making a positively-driven valve gear which may be operated at high speed.



SINGLE CYLINDER, ROBB CORLISS ENGINE.

The valve gear is positive. It does not let go of the valves, but with positive action opens them quickly, closes them promptly, and holds them stationary during the closed period, which is over half the time, and constitutes that period when the unbalanced pressure between the steam pipe and the cylinder would cause friction. Elimination of many working parts, all latches and detachable pieces gives a smoother running gear, with fewer surfaces subject to wear, and a gear quite noiseless, even at high speed.



VALVE GEAR CASING, WITH COVER REMOVED.

The greater possibilities of high-speed Corliss engines, especially the driving of generators direct-connected, call for the use of a positive valve gear which fulfills every requirement for this class of difficult work, while enclosing the valve gear in a tight casing, so that all working parts are in a bath of oil, reduces to a minimum the friction and wear detrimental to releasing gears.

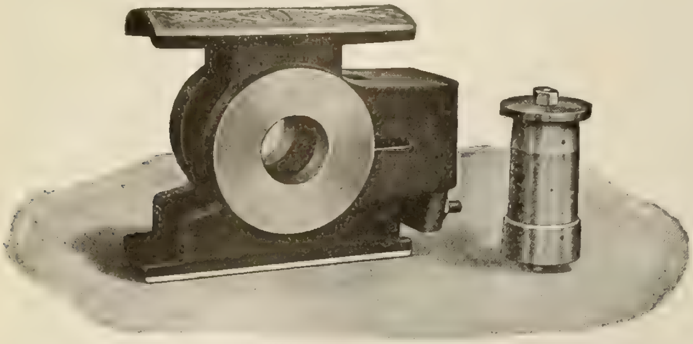
Eccentrics.

A more desirable and economical steam distribution is possible with the double eccentric arrangement as it permits of an independent setting of exhaust valves for release and compression. Two eccentrics are used in the Robb Corliss engine, one forming a part of the governor and controlling the steam valves, and the other operating the exhaust valves through a wrist plate in the usual way.

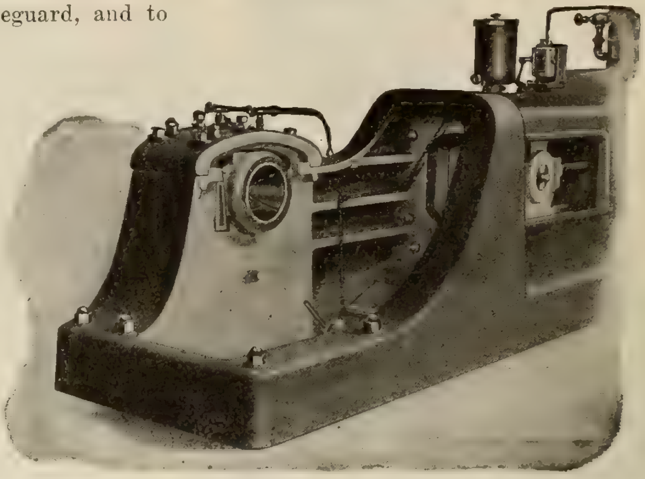
Cut off is controlled by the Robb Governor which is a modification of the Sweet shaft governor. It is located in the fly-wheel of the engine, and drives the valve gear and controls its operation. It gives positive quick action, with closer regulation than the indirect method of governing.

Simplicity and power are combined by

reducing the number of main parts to three, and carrying the centrifugal weight upon a spring entirely independent of any bearings. The heavy strain caused by centrifugal force is not brought on the suspension pin because it merely carries the eccentric and drives the valve gear. Under these conditions, it is easily lubricated for long periods. In all positions the governor is in gravity balance, because the eccentric balances the centrifugal weight. Disturbance by the reciprocating motion of the valve gear is prevented by the inertia of the weight, and quick regulation is obtained by placing the weight so that it gets sufficient effect from inertia.



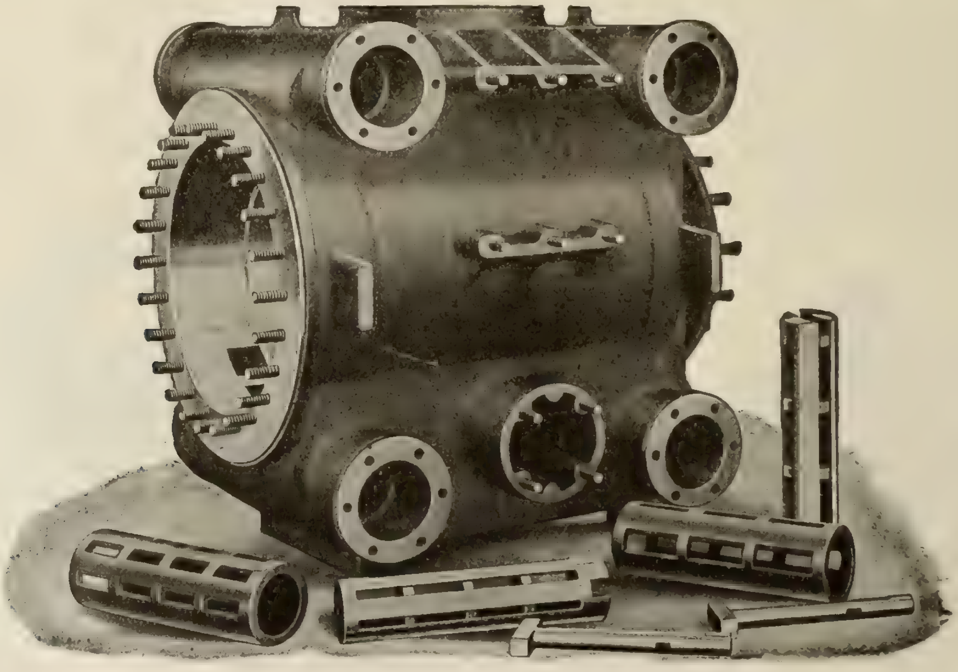
CROSSHEAD. ROBB CORLISS ENGINE.



CRANK END OF BED SHOWING OIL PIPING, ROBB CORLISS ENGINE.

Lubrication.

In common with most up-to-date engines, the moving parts of the Robb Corliss engine are completely enclosed, affording ample protection for the moving parts and cleanliness of both engine and engine room. The bed castings are so arranged that the oil is retained and carried to the crank pit, and from this point it is distributed to all the bearings of the engine by means of an oil pump driven from the crank pin.



CYLINDER, VALVE AND BUSHES OF ROBB CORLISS ENGINE.

Positive lubrication is thus assured, but as an additional safeguard, and to provide for any emergency, an oil reservoir is mounted on top of the engine ready for immediate use in case anything should go wrong with the oil pump. In this way, the system of lubrication is practically duplicated. The pressure is kept constant by the relief valve in the oil piping. Cylinder lubrication is provided by a sight feed lubricator, and by a positively-operated power pump of approved design with oil pipes leading to the cylinder at the proper points.

Balance.

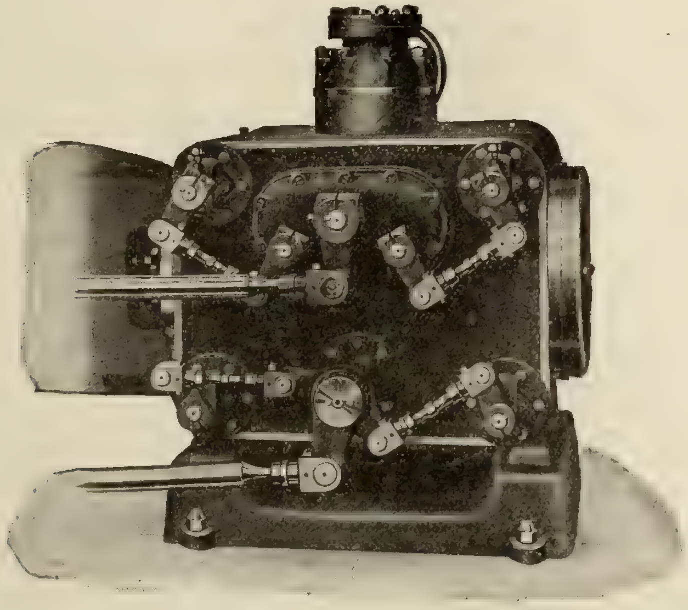
The reciprocating parts are balanced for running conditions by properly counterweighting the cranks and setting the valves to give correct compression to cushion the reciprocating parts at the ends of the stroke.

General.

To obtain that much desired combination in engine building, constant operation day after day without attention, minimum upkeep, and economy in both steam and oil,—builders must use heavier designs and provide for higher speeds and greater pressures. Saving of floor space also is a feature that must not be lost sight of when all-round efficiency is desired; nor can cleanliness of engine room be neglected when designing an engine for the up-to-date power plant.

It has been customary to consider the Corliss type of engine efficient as regards low steam consumption, but it is as freely admitted that the usual forms do not have the compactness that comes from short stroke and high speed, nor are they often enclosed. The relatively long stroke and low speed of the older Corliss engines require a large floor area by themselves, and the amount of room taken up is still greater when they drive electric generators by belts.

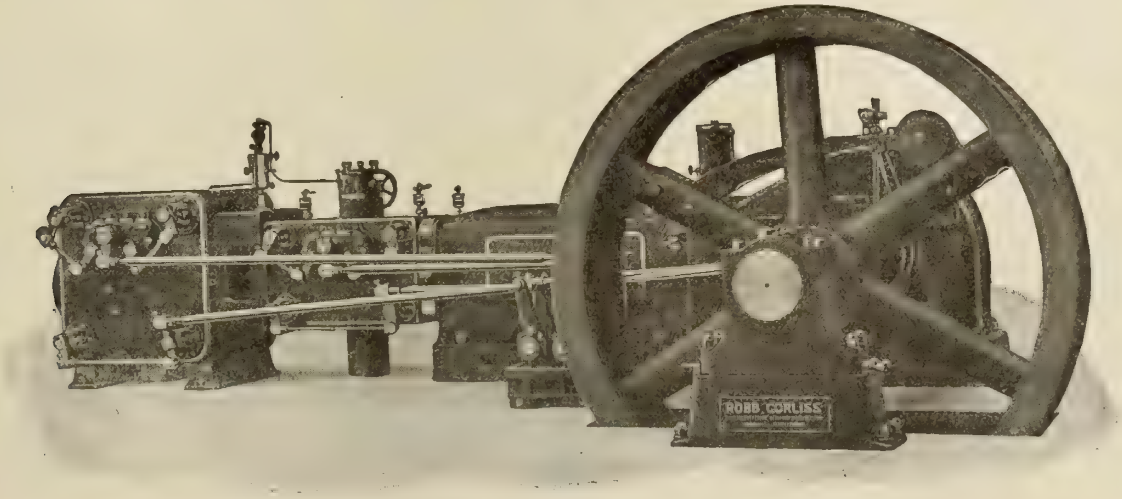
If the generator armature is placed on the engine shaft in order to save some floor area, its speed is necessarily so low that the generator is very large and therefore expensive.



VALVE GEAR, ROBB CORLISS ENGINE.

THE PASSING OF THE PIGEON-HOLE.

LUTHER M. GULICK, M.D., in The Ford Times, tells how he found that one of the leading publishing concerns had dispensed with roll-top desks and equipped their entire establishment, from stenographer to head of department, with flat-top desks. He says that, in answer to his inquiry, he was informed that it expedites business.



TANDEM COMPOUND, ROBB CORLISS ENGINE, TYPE "F."

''Take the case of a claim that must be passed along from one hand to another until it has been corrected and O.K.'d five different times. Now, if that claim can get stuck in a pigeon-hole anywhere—a thing that used to happen right along—it's likely to be forgotten. The result is, delays and confusion and ragged business generally, but if there are no pigeon-holes and it has to lie in plain view on top of the desk, it can't be forgotten until it is attended to.''

''For those who have ears to hear,'' continues Dr. Gulick, ''the flat-top desk has a moral. It stands for a principle which is applicable throughout one's mental life. It stands for definite, clearly-marked stages—stopping points—breaking-off places. Unlike the man with a too big idea, the man with small, everyday ideas keeps his mental balance not primarily because his nervous system is of a more stable character—though that may be true, too—but chiefly because his little ideas work out directly and successfully; he can get them done with and out of the way. His jobs are finishable. He enjoys good mental health.

''Big problems can be split up. They are always reducible to fractions—at least for practical purposes they are—and each fraction can be dealt with separately. We do not need always to keep ourselves staring at the whole, worried by its magnitude and its difficulty and its imperative claims. When a man quits his desk at night with the assurance that everything has been brought to a definite stopping place, and that to-morrow he will know just where he stands with reference to the day's work, he can really rest. It's a very different state of mind from the one that comes when he pulls down the cover over a mussy array of odds and ends, and runs.

''The greater the pressure under which a man works—the greater the actual count of his responsibilities—the more essential it is that he should be able to get away from them. The consciousness of freedom is a thing that stays there in the back of his mind even when he is smashing and driving away at his work; and it's a saving knowledge. It brings confidence, helps him keep his balance.

''The flat-top desk cleared of the day's debris, clean and fresh for to-morrow's new duties, or for its new instalment of old duties, is a symbol worth bearing in mind. The brain of the man who has taken its moral to heart keeps fresh and clear, because it earns its night's repose. Most big victories, when looked at closely, turn out to be only piled up results of many small victories, such as are always achievable in the well-directed manoeuvres of each separate day.''

FOUNDRY PRACTICE AND EQUIPMENT

Practical Articles for Canadian Foundrymen and Pattern Makers, and News of Foundrymen's and Allied Associations. Contributions Invited.

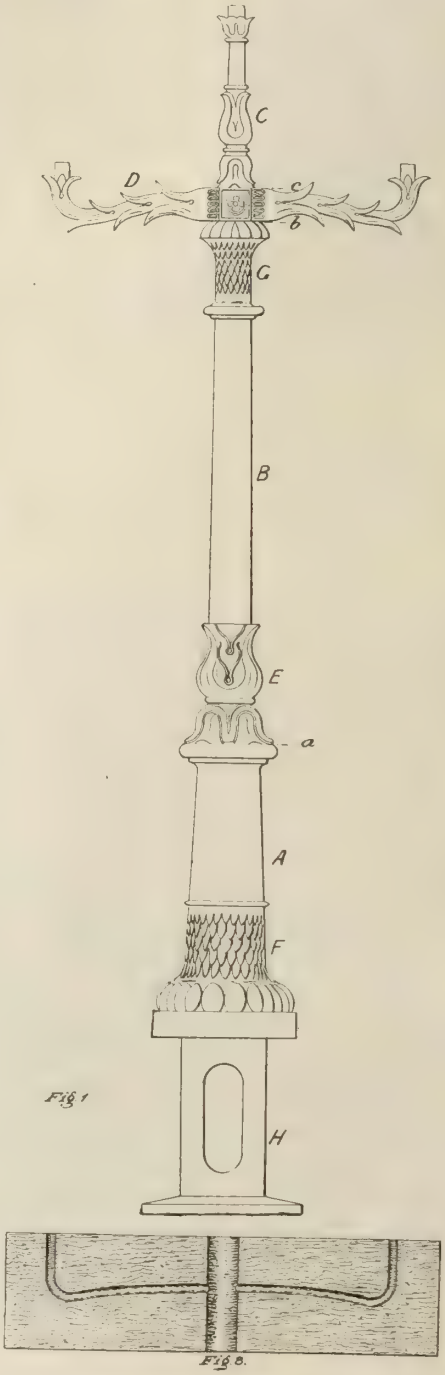
CARVED LAMP STANDARDS.—I.

By Joseph Horner.

At one period of my life I had a considerable amount of practice in the ornamental side of patternmaking, doing work on columns, lamp standards and railings, which entailed carving, in addition to the constructive work necessary in the building up. Little of this is done outside the shops where these things are a specialty, and when occasional jobs of this kind come in, the help of a professional wood carver is often sought. That aid is objectionable from one point of view, because the carver knows nothing of the moulder's requirements for delivery, and he instinctively undercuts in order to throw parts into bolder relief. The patternmaker must then go over the work afresh, spoiling some of the effect in order to provide for the necessary withdrawal of the patterns from the sand. An article or two on this aspect of patternmaker's work may be helpful to some readers.

Take first the lamp standard, Fig. 1, the pattern work for which was made by the writer a good many years ago. In all examples of this kind where there is considerable disparity in dimensions, the practice always is to build the casting up in separate pieces. Just in how many is a matter for judgment, so that alternatives are legitimately adopted. In this case, the casting was in four separate pieces, comprising the base (A), the shaft (B), the smaller lamp stem (C), and the cross arm (D), which carried a lamp at each end. Joints between these are made at (a), (b), (c), in spigot and socket style, usually with plenty of clearance to receive the lead poured around, and sometimes "stemmed" in, but having narrow chipping strips for centering and holding the parts. The strips ensure a fit, and the lead fills up and prevents rocking movements, and displacement afterwards.

The ornamental belt (E) might alternatively be made separately, and fitted to spigots on (A) and (B), or the lower portion of (F) might be so made, the upper portion being still cast with (B). These are details the settlement of which do not matter much one way or another, only that it is not desirable to multiply joints unless the preparation of the work is simplified by doing so. It is always simplified by making a joint between adjacent portions much larger and much smaller, as between (A) and (B), for reasons which a moulder will appreciate. Not only is the work of coremaking less troublesome, but the moulding boxes are simplified, and are more readily handled than when relatively large and small parts are contained in one box. We will now consider the methods by which the pattern parts are prepared, and which apply in the main to all work of this kind.



FIGS. 1 & 8. CARVED LAMP STANDARDS.

Preparation of Pattern Parts.

The base portion (A) being large, is lagged up, while (B) and (C) are turned in solid stuff, jointed and doweled, and (D) is jointed and doweled in the solid. The portions (E), (F), (G) were made in loose pieces, skewered on, otherwise the carved work could not have been delivered. The number of joints in the loose pieces depends on the undercut in the carved work. The fitting of the loose pieces to the pattern bodies may be made into turned recesses, or on flat angular facets, the latter being the better method. The details of this work are shown in subsequent figures which illustrate the patterns of the several portions of the lamp standard.

Fig. 2 shows the lower or base portion opened in the joint face. The plain circular parallel portion, or "root," (H)—compare with Fig. 1—which goes below the ground, is conveniently made separately from the other tapered portion. To lag the two up in one would require strips much thicker than need be used if the parts are made separately. The lagging strips are glued and screwed on across bars, (a), (b), (e), these being narrow strips, but the other bars, (c), (d), are prolonged to turn the core prints on, and to receive the flange (h) and the dovetail by which (b) is united to (e). The grain runs longitudinally in (c), (d). The lagging strips being of moderate thickness, say about 1½ in., the mouldings and flanges are added. The upper moulding (f) is glued on in blocks, the grain running the same way as that in the lagging. The square flange (h) is fitted as most flanges are, by boring out a hole to fit over a turned neck on the body. Flange (g) which fits on the stone at the ground level, is made solidly, and screwed to the piece (e). The bead (j) is fitted and glued into a recess and turned in place. The carved base (f) is fitted around in pieces in a recess, first turned, and afterwards planed with flats.

The pieces are secured temporarily, either with paper joints or with fine screws while being turned to the sectional shape, after, which the ornament supposed to represent fish scales (compare with Fig. 1) is marked out and cut with chisels. Care must be taken that no edges shall be undercut in relation to the direction of delivery. The loose pieces may be held during ramming either with skewers from the outside or with screws from within. A core board is required, Fig. 3, which calls for no observation.

The main shaft (B) of the lamp standard in Fig. 1 is shown opened in the joint face in Fig. 4. The spigot and (a) fits into the hole cored in the top of the base (A), while the end (b) fits into a hole cast in the arm (D). The core prints extend beyond these spigot ends as shown. The carved portions (E) and (G) are treated like the piece (F) was on the base in Fig 2. They are divided suitably for separate withdrawal, and they fit on facets, as shown in section, being cut in recesses and turned first on the body of the pattern. As before, undercutting in relation to the line of withdrawal of each piece must be avoided. Division of the portion (E) may be obviated and, instead, it may be glued solidly on the body if a little detail is sacrificed. If the flanks are left smooth and the device shown in **Fig. 1 is cut to deliver only in the bottom and top of the mould, it can be left** solid. A little veining may be done at the sides if undercut is avoided, and the plain aspect be thus relieved.

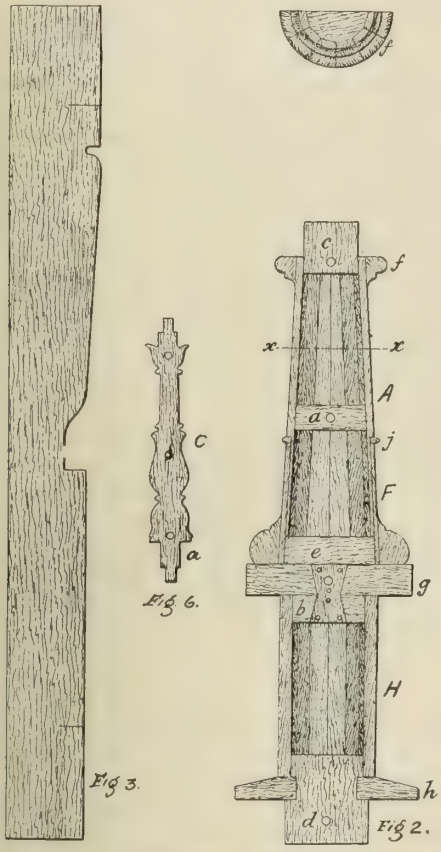


Fig 6. Fig 3. Fig 2.

FIGS. 2, 3, 6. CARVED LAMP STANDARDS.

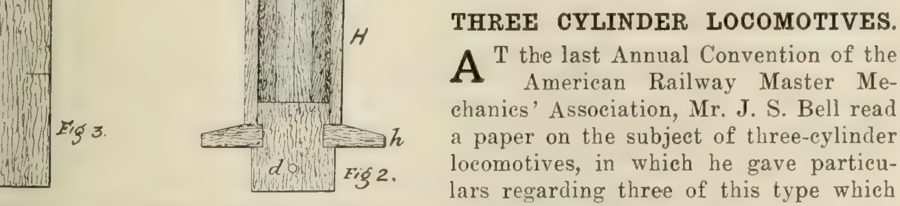

FIG. 7. CARVED LAMP STANDARDS.

The core board is shown in Fig. 5. It follows the outlines of the outside very closely, since there is only a slight amount of undercutting anywhere.

Fig. 6 shows the pattern of the top portion (C) of the standard, open in the joint face. It fits by the stem (a) into the hole in the top of the main shaft (B), and is cored through with a plain straight core. No portion is left loose, but the carving shown in Fig. 1 is done to deliver freely.

The arm pattern (D) is shown open in its joint face in Fig. 7. Nothing is left loose. The core prints (a), (a) are for the hole which receives the top of the stem (B). The timber grain in this pattern is weak where it curves upwards at the ends, but it is hardly a job for halving pieces in at right angles, being too flimsy. The best way is to cut the pattern in mahogany or other hard non-warping wood, and, if a considerable number of castings should be required, an iron pattern might be made. A core box is required, and a half box will do as seen in Fig. 8.

THREE CYLINDER LOCOMOTIVES.

AT the last Annual Convention of the American Railway Master Mechanics' Association, Mr. J. S. Bell read a paper on the subject of three-cylinder locomotives, in which he gave particulars regarding three of this type which have been giving good service on the Philadelphia and Reading Railway. The three cylinders are placed on the same horizontal plane, one between the frame and other two exterior to the frame. They have the same diameter, 18½ in., and each has its own piston valve. They have been engaged for several years in fast passenger service, principally on the New York division of the road, where they have been doing very satisfactory work.

Their principal advantages are that they secure a uniform turning moment, the cranks being placed at 120 degs.; they exert greater tractive power, and they call for a lower factor of adhesion than two-cylinder engines. They are easy on rails and bridges; afford opportunity for better balancing; and can be operated on the simple, compound, or triple-expansion principle.

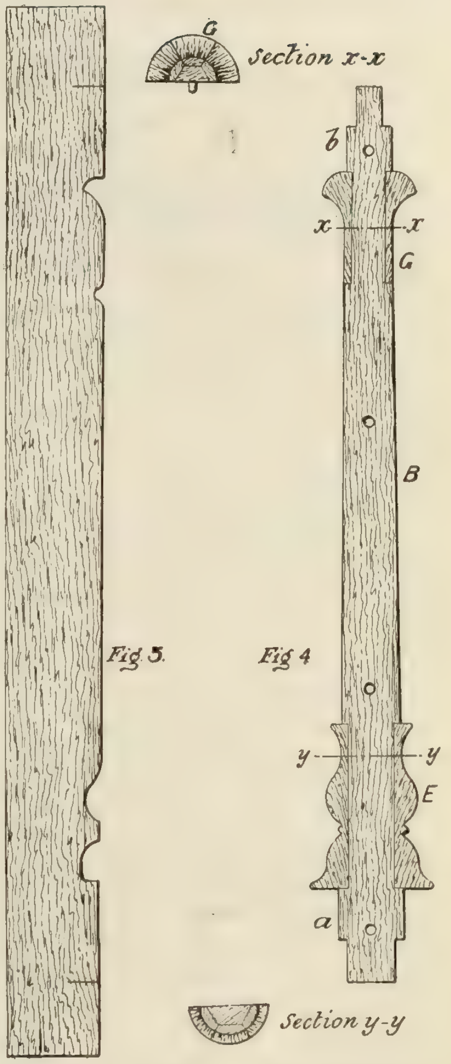

Fig 5. Fig 4

FIGS. 3 & 4. CARVED LAMP STANDARDS.

SEVENTY MILLION BUSHELS OF GRAIN IN TWO MONTHS.

IN the month of October, the C.P.R. moved 28,003 freight cars from Winnipeg to Fort William, the greater portion of which contained grain. To date, October 31, since September 1, there have been loaded on the Canadian Pacific Railway lines in the West, 49,149 cars of grain, 29,344 of which were loaded with wheat. The total grain moved this year from September 1 to October 31, was seventy million bushels.

Eightythree million bushels of grain were marketed at stations on the Canadian Pacific Western lines since September 1, three-fourths of it being wheat. In the same period last year forty million bushels were marketed.

From Port Arthur elevators on November 1, there were shipped 919,394 bushels of grain, a new high record for a day's shipment.

COMPRESSED AIR EQUIPMENT IN THE FOUNDRY.

ON a previous occasion, reference was made editorially to the place and value of compressed air equipment in the modern foundry, and while drawing attention to the article on the subject in the present issue, a moment's thought on what compressed air has made possible at the Annual Foundry and Machine Exhibition, through its easy production and transmission, leads the most unimpressionable of us to the conclusion that but for its place and part, much of the noticeable foundry progress would have been still unrecorded.

FOUNDRYMEN'S CONVENTION AND EXHIBITION.

THE recent Foundrymen's Convention and Exhibition in Chicago, easily broke record for attendance, as well as for class and variety of exhibits. The machine tool section was an added attraction on that occasion, and, for a first year, we believe, exceeded the most sanguine expectations of the promoters. It was just sufficiently successful to make those who held back feel somewhat chagrined that their product was not represented, and as a consequence, we look to see machine tool builders out in largely increased numbers when the 1914 show opens its doors.

The double function demonstrated that the progressive attitude displayed by foundrymen in recent years is becoming more accentuated in practical effort towards still greater achievement, and while the interest in this Annual Convention and Exhibition is not as widespread as it might and should be, there is no getting away from the fact that their influence is gradually permeating the ranks of employers and operatives in the direction of a more intelligent conception of the craft requirements, and of the results to be obtained by scientific and systematic investigation of the various factors entering into, and problems arising from foundry practice in each and all of its sections and departments.

The development of labor-saving tools and appliances goes on apace, a conclusion easily arrived at by a comparison between the recent Exhibition and its predecessors. In such circumstances, it is plainly evident that while much knowledge of the progress may be appropriated by the perusal of catalogue and circular matter, there is no gainsaying the strength of the appeal made by inspection of a machine and a demonstration of its accomplishments in operation. This annual show affords this latter opportunity.

The interest taken by Canadian foundrymen in this great objective, while encouraging and showing an annual increase in numbers of those who find it convenient and profitable to be in attendance, is not in any way commensurable with the extent and variety of the foundry business in the Dominion, and while there may be difficulties, more or less real, which bar a few, we believe that foundry proprietors fail in their appreciation of the investment value, not only of a first hand study of equipment and apparatus by having one or more representatives present, but fail to realize the benefits which a man receives in the way of encouragement and enthusiasm in his work, by meeting and associating with his fellow-craftsman.

As already mentioned, a machine tool section formed part of the recent Exhibition, and here as in the case of the general or foundry equipment, manufacturers showed products in operation, for the most part. It was meet that, at some stage of the game, the machine shop and foundry should get together, as there is much in common in their aims, and many problems that the combination can satisfactorily solve. The introduction of machine tools as a part exhibit will tend to widen the scope and influence of the Exhibition as a whole, and while in some quarters there may be a disposition to believe that the original idea and purpose is being somewhat lost sight of, we feel that the trend is wholesome, both for the foundryman and the machinist. A uniformly successful Exhibition record is not to be looked for, either by the large or small manufacturer, and all who have had their product regularly on display during recent years, have experienced more or less of the vicissitudes of business results irrespective of the increased general success. There is, of course, the risk of the small exhibitor being more or less snuffed out in the matter of display, yet the very circumstance should prove a welcome incentive to greater effort.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Nov. 3, 1913.—Trade in most lines hos been a little quieter during the past week, but the falling off has not been serious, and is doubtless of a temporary nature. At all events, there are no signs of any diminution in the prevailing spirit of optimism. There seems to be no good reason why business during the coming winter should not be well up to the average of previous years. It is true that the banks are still somewhat chary of lending money for any but the most gilt-edged schemes, but for which it is probable that the building trade in Montreal would be quite active all through the winter, with a corresponding demand for structural steel, sheets, cement, etc. As it is, the next three or four months will see a slowing up in building operations.

There is nothing to record in the machine tool line this week. Before the end of the week, however, specifications will have been received for the machinery required for the repair shops and roundhouse of the Grand Trunk Pacific Railway at Prince Rupert, B.C. This business will not probably run into more than $12,000 or $15,000, but will nevertheless be keenly competed for.

With regard to the equipment for the new shops of the National Transcontinental Railway near Quebec, it had been expected that specifications would be sent out very soon, but later information from an authoritative source leads one to believe that they need not be looked for before the middle of December.

Metals.

Business in English and Scotch pig iron is now drawing to a close for this year, the last shipments being expected shortly. A brisk demand for these brands has been a feature of the market during the past couple of months, consumers buying readily in order to have a good supply for winter use. On the other hand, the demand for Canadian and American pig is dull, people buying in a hand-to-mouth fashion owing to the prevailing scarcity of money.

Copper, after a rise in the middle of last week, has fallen back again. There is little doing in this metal at the present time, consumers apparently having sufficient supplies on hand to enable them to hold off until the price drops somewhat. Conditions in the Lake Superior district continue to improve, and the Calumet and Hecla plants are now operating at 75 per cent. of normal output.

Lead remains firm at $5.50. Supplies are very scarce for immediate delivery, and the recent hopes of an early resumption of smelting operations in Mexico do not now seem very likely to be realized. There is, therefore, no immediate prospect of any relief from the present shortage of this metal, and while consumers continue to buy from hand to mouth, there is barely enough material to satisfy even this restricted demand.

Toronto, Ont., Nov. 3, 1913.—Some engineering concerns in and around Toronto are so busy they are putting on night staffs; some are so idle they are taking off day staffs. A traveler for a sheet firm told of visiting the plant of one of the largest stove manufacturers in Canada, this week. He found the workmen engaged in fixing lamps around the plant, and doing repair work. A representative of one of the largest metal concerns in Canada, said, "We're as busy as blazes, but doing nothing," and that seems as apt an expression to describe business just now as can be conceived.

Mention was made last week of the fact that makers of implements are sending machines West with no hope of receiving pay until November, 1914. Steel makers are handling such business very carefully, and are not anxious to supply material on such conditions. Extensions to plants are becoming rarer every week, as the banks are frowning on development work of this kind.

Regarding the cutting of structural steel prices by big engineering concerns and bridge builders, this cannot last long, and this method of obtaining quick money is frowned upon by most concerns. Dealers do not like it, as they are unable to compete, the vendors being their own customers.

One or two small railways have, this week, been calling for prices on rails, but enquiries of this nature are not taken very seriously. Despite the state of trade, railway schemes in Ontario seem to develop at a remarkable rate. T. J. Glover, promoter of the Forest Hill Railway, announced yesterday that he would spend $50,000 this year on construction work.

The price of bars is firm, and business is fair. No big volume of business has been done in wrought iron pipe, but the demand is steady.

New discounts on bolts and nuts were issued November 1 by the Steel Company of Canada. The reduction in price is made to meet competition across the line which, while not severe, is being met.

Drummond, McCall & Co. are not selling pig iron at all here, now. They carried that which is being made at Port Colborne for a while, but just to fill standing orders. They report the demand as slight. Contracts for steel to be used on the boat being built by the Collingwood Shipbuilding Co., have not been let.

A tool steel traveler who has just returned from the West, reports that the demand for tool steel is improving. Contractors on the new Welland Canal have not reached rock yet, and will not require steel for their rock drills for a month or more.

The Steel Company of Canada report good sales of pig iron at prices ranging from $18.50 to $19.00.

Machine Tools.

A dealer in machine tools returned from Western Ontario this week, where he found no demand for this class of machinery. The A. R. Williams Machinery Co., who are moving their warehouse, report a slight movement in woodworking tools. The demand for electrical equipment which has been slack, is now improving. This includes motors and portable electric tools. Dealers think the arrival of cold weather will help business.

Metals.

The metal market is dull. There is no drop in prices, and no big sales. Business is still conducted in a hand-to-mouth manner.

St. John, N.B., November 3.—Definite announcement is expected next week regarding the possibility of the Ford Motor Co. having a branch at St. John in connection with the development of their automobile business. It is said here that they will take over from the Maritime Motor Co. a portion of their large plant at Coldbrook, and will operate it at first for the assembling of the parts of their cars, and later possibly for their manufacture. Whether this is correct or not will not be known definitely for a few days, but the first part of it at least is quite generally believed.

The Maritime Motor Co. have finished their season of active manufacturing at their Coldbrook plant, and the operations during the winter will consist mostly of repair work and renewals. The next manufacturing season is expected to be a comparatively busy one, and plans cause the anticipation of at least 300 cars being built at the Coldbrook works.

If present plans are completed satisfactorily, the new grain conveyors to be erected at Sand Point, St. John harbor, will be finished in February. Nearly one hundred men are now at work upon them, and more are to be added later. Two 75-horse power motors are to be erected in a tower which is to be attached to the conveyors.

Local manufacturers and merchants throughout the Maritime Provinces are keenly interested in the matter of the opening of the winter port season this month, and matter now in dispute between the City and the Government as to whether or not the port of St. John will lose the regular sailings of some lines. Delegations from the Board of Trade have interviewed the Cabinet at Ottawa regarding the question, and they have urged the cancellation of an agreement between the I.C.R. and C.P.R. in which they claim St. John's interests are being discriminated against in the matter of freight rates.

Prospects of power development at Meductic, above Fredericton, N.B., are more promising since the report of the International Commission on the St. John River, that the dams which the St. John Hydro-Electric Co. propose to construct, would not violate the terms of the Ashburton treaty. Plans for the power development have reached quite an interesting stage, and the Government may be asked to decide as to which is the more valuable, the salmon fishing industry which may be injured by the dams, or the development of the power possibilities which are said to be really remarkable.

The development of the gas well at Moncton is being pushed ahead vigorously, and a new well was struck this week at a depth of only fifteen feet. It is thought that the gas area extends for quite a distance in Albert county. Manufacturers in the "railroad city" and merchants generally are decidedly pleased with the possibilities of much cheaper power and gas.

Recent Judicial Decisions

Kingston, Ont.—The Canadian Locomotive Works Co. gave $3,000 to the widow of Melville Knapp, who sustained fatal injuries at the works on September 15. The Company also paid the funeral expenses. The Coroner's jury decided that Knapp was at fault in doing work that he was not called upon to do, but his willingness gave the opportunity to the company to manifest this regard for his good services.

Montreal, Que.—Mr. Justice Beaudin recently dismissed a petition for an injunction which entailed a serious principle, namely, whether a firm can lawfully bind an employe not to work for another firm, after he has left the first one. The Canada Metal Co, of Toronto, sought to have John Berry, a commercial traveller, prevented by the court from acting in that capacity for a rival firm, Lazarus, Cohen & Co., because he had signed with the Canada Metal Co. In the contract he had pledged himself not to work for another Company for one year after he left the Canada Metal Co. The court took the view that a man's right to earn his livelihood could not be tampered with, and except for very serious reasons, and as in the present instance, he could be replaced easily, there was no ground for preventing him from working in the employ of another company. The same principle has been affirmed before by the courts, including the Court of Appeal.

Montreal, Que.—The Dominion Iron & Steel Co. was, last week, condemned to pay the Mechanical Equipment Co. the sum of $13,000 claimed by the latter as the contract price of two nail making machines manufactured and delivered to defendant by the plaintiff. Action had been entered against M. J. Butler, the late vice-president of the Dominion Iron and Steel Co. as well as against the company itself. In the course of the hearing it was shown that the defendant, Butler, had negotiated the purchase of the machinery, but the court held that the action should be dismissed as far as he was concerned, because in his dealings with plaintiff he had not acted in his individual capacity but as an officer of the defendant company. The claim was opposed by the company on the ground that the machines did not pan out as expected and as stipulated in the contract. The hearing of the case occupied a couple of weeks, in the course of which voluminous testimony of a highly technical character was rendered. As a net result, Mr. Justice Dunlop found the claim well founded as against the company. The defendant had ordered three machines, and after delivery of the first, refused to take delivery of the second, which, however, was delivered and received on the premises under protest. The order for the third was then countermanded. The first was paid for as soon as delivered. The second was never given a trial, as the company expressed dissatisfaction with the first and presumed the second was no better.

The court, after summing up the evidence of a few nail machine operators brought from the States, held that the defendant had failed to prove that the first machine was incapable of doing the work which it was intended to do. It was in fault for not having given the second at least a trial. As the concern had entered into a contract to buy the machines at a certain price, it was incumbent upon it to pay the price stipulated.

INFORMATION FOR INVENTORS.

PIGEON, Pigeon & Davis, Patent Solicitors, St. James St., Montreal, report that 128 Canadian Patents were issued for the week ending October 7th, 1913, 83 of which were granted to Americans, 23 to Canadians, 11 to residents of Great Britain and Colonies and 11 to residents of Foreign countries.

Of the Canadians who received Patents, 14 were residents of Ontario, 4 of British Columbia, 2 of Quebec, 1 of Saskatchewan, 1 of Nova Scotia, and 1 of New Brunswick.

In the United States for the same week, 725 Patents were issued, 5 of which were granted to Canadian inventors.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Ft. William, Ont.—The Orpen Conduit Co., 165 King St. W., Toronto, intend erecting a plant here.

Sydney, N.S.—A new 40-ton Morgan electric crane has been installed by the Steel Co. at their plant here.

Petrolea, Ont.—The ratepayers have voted $30,000 to enable the Petrolea Wagon Co. to make extensions.

Caledonia, Ont.—A new machine and foundry shop has recently been started here by Messrs. Logan, of Barrie.

Biggar, Sask.—The G.T.P. will add twelve or more stalls to its roundhouse, and will add a large machine shop.

London, Ont.—A small blaze at the Stewart foundry gave the firemen a run last Saturday night. The damage was small.

Kingston, Ont.—The ratepayers have granted a bonus of $75,000 to the Kingston Iron and Tube Co., who will erect a new plant here.

Hamilton, Ont.—Fire did $200 damage to the plant of the National Machine & Supply Co. at 48 Market St. on Saturday, October 25.

Toronto, Ont.—Roden Bros., silversmiths, have been granted a permit for a 3-storey factory, near Wilton Ave., costing $40,000.

Regina, Sask.—Plans are being prepared for a warehouse and repair shop for the Emerson, Brantingham Implement Co., Rockford, Ill.

Fort William, Ont.—J. O. Callaghan announces that when the wire factory now under construction here is completed, several other plants will be constructed.

Toronto, Ont.—The reorganization committee of the Lake Superior Iron and Chemical Co. has given notice that the plan agreed to last June is now operative.

Transcona, Man.—The tracks for the car shops are now completed, and the engineer, H. H. Pinch, and master car builder, J. J. Hodgson, are busily engaged installing the machinery.

New Hamburg, Ont.—The Silversmith Co. have let the contract for a large addition to their present factory, the building to be 70 by 40 feet, three storeys high, built of brick.

Curling, Nfld.—F. G. Brake is going to Bridgewater for the winter to study engineering and machine work, and, with the aid of a partner, intends to start a repair shop on his return.

Fort Erie, Ont.—Toronto and Cleveland capitalists have taken options on 100 acres of land here, and will build a factory for the manufacture of automobiles and heavy grade motorcycles.

Goderich, Ont.—The American Road Machine Co. of Canada will manufacture galvanized iron goods in their present factory when the new one is finished. They ask the town for a loan of $50,000.

Kingston, Ont.—On November 3 the ratepayers will vote on a scheme to bonus the Kingston Iron and Tube Co., capitalized at $1,000,000, employing 180 men, and paying $125,000 a year in wages.

Port Arthur, Ont.—Engineer A. B. Edwards was in Port Arthur last week making all preliminary arrangements for commencing the erection of buildings of the Conley Frog and Switch Co. early next spring.

Victoria, B.C.—McDonald, Godson & Co., the lowest tenderers for steel rivetted pipe in connection with the Sooke water scheme, have been awarded the contract, and will erect a factory in Victoria, to do the work.

Winnipeg, Man.—The Empire Waterworks Supply Co. of Canada, Ltd., have been incorporated at Winnipeg, and will manufacture waterworks supplies of various kinds, including piping, etc. The company is capitalized at $100,000.

Coquitlam, B.C.—Coquitlam has been selected as a grain elevator site by a group of Fort William, Minneapolis and Winnipeg capitalists, according to word received recently. The syndicate is headed by Mr. J. H. Henderson of Fort William.

Calgary, Alta.—Mr. Griffin, the senior partner of the Griffin Wheel Co., of Chicago, will presently pay a visit to this part of Western Canada with a view to selecting a suitable location for a large plant. Between 1,500 and 2,000 men would be employed.

St. Marys, Ont.—A 70-feet addition to C. Richardson & Co.'s dairy utensil factory on Wellington Street is being rushed with all possible speed, so as to have the building roofed in before hard weather sets in. The building will be two storeys high, and built of stone.

Saskatoon, Sask.—C. J. Buckeye, of Buckeye Engine & Foundry Co., Joliette, Ill., will locate a plant at Factoria, near here, if the city will come to terms. He will erect a machine shop, 50x150, a foundry 40x70, and a storeroom and boiler house. Sixty to one hundred men will be employed.

Winnipeg, Man.—The Good Roads Machinery Co. have been incorporated at Winnipeg to build road making machinery. This concern was organized by William E. Clark, president of the Carbon Oil Works, Ltd., and the company have a temporary office on the fifth floor of the Maltese Cross Building.

Brantford, Ont.—At a meeting of the directors of the Brantford Motor Truck Co. on October 28, the concern was put into liquidation, and J. S. Dowling was appointed liquidator. Fifty thousand dollars was required to keep the business afloat, and the directors do not care to spend this amount.

Montreal, Que.—It is reported here that W. W. Butler, vice-president of the Canada Car & Foundry Co., is organizing another car company to be known as the W. W. Butler Co., Ltd., with $100,000 capital.

Medicine Hat, Alta.—The city has voted a free site, free gas and water to the Western Threshing Machine Co., which is capitalized at $100,000, and work will be started on the manufacture of threshing machines as soon as possible. J F. Davies is president; V. W. Parrish, secretary, and H. B. Yuill, treasurer.

Levis, Que.—The question of the reopening of the machine shops of the Canadian Shoe Machinery Company, at present in liquidation, was discussed at a meeting of the Levis Town Council last week. A syndicate of capitalists, headed by C. H. Carrier, formerly of the firm of Carrier, Laine & Co., are prepared to open up and carry on a large machinery business if they can secure the lease of the premises. The syndicate guarantees to employ between 350 and 400 men. The council decided to recommend the Minister of Public Works to consider the proposition of the Carrier syndicate.

Winnipeg, Man.—Plans for the new engineering building in connection with the Manitoba University at St. Vital are now in the hands of Professor Brydon-Jack. The building will be 200 feet long and 75 feet wide, three storeys in height, with basement. In addition it will have two "L" wings, each 70 feet long and 40 feet wide, two storeys in height. Construction will be commenced as soon as possible.

Almonte, Ont.—A foundry will be opened by Kir-Benn, Ltd., a company recently incorporated with $200,000 capital. A general meeting of shareholders was held on Wednesday, Nov. 5, for purposes of organization. T. W. Kirby, of Hamilton Stove & Heater Co., has been appointed manager, and the plant should be operating by January. Alfred M. Greig and Wm. H. Stafford, Almonte, are interested. Stoves and furnaces will be made.

Electrical

Burford, Ont.—An effort will be made to get Hydro-Electric power here.

St. Catharines, Ont.—The ratepayers have voted in favor of Hydro-Electric power.

Quebec, Que.—The Dorchester Electric Co. will improve the lighting in Limoilou.

Grantham, Ont.—The Ratepayers of this township are asking for Hydro-Electric rates.

South Bolton, Que.—A steam power plant will be installed by Mr. Houldsworth in his mill.

St. Mary's Ont.—$5,870.30 has been passed for extension and improvement in water and electric light works.

Elmira, Ont.—Hydro-Electric power was formally installed in Elmira on October 29. The village will take 250 h.p.

Moose Jaw, Sask.—The Kasow Electric Co., and the A1 Electric Co., both of Moose Jaw, have assigned in favor of creditors.

Winnipeg, Man.—The Provincial Government will erect a power house to cost $158,000. General contractors, National Construction Co.

Port Arthur, Ont.—The C. N. R. are installing an electric plant at Atikokan, the chief divisional point between Port Arthur and Fort Frances.

Vancouver, B.C.—The city is seeking additional water power. Ald. Black, chairman of the civic water committee, has been to Victoria about it.

Victoria, B.C.—The city council has authorized improvements to the city's electric light plant, which will provide workshop facilities for the employees.

Strathroy, Ont.—The ratepayers must either take Hydro power or spend a large sum on the municipal plant. The wiring is bad, and a new boiler is required.

Grantham, Ont.—The township has been offered electric power by the Hydro-Electric Commission at very low rates. $38,000 will be spent on construction.

New Glasgow, N.S. — The Pictou County Electric Co. have purchased new equipment, consisting of boilers, engines, generators, etc., for their power plant at Stellarton, N.S.

Owen Sound, Ont.—The Council has authorized the Mayor to sign a contract with the Hydro-Electric Commission for twelve to fifteen hundred horse-power from Eugenia Falls.

Montreal, Que.—The Laurentide Pulp and Paper Co. will drive all their machinery by electricity when the new power house supplying 100,000 h.p. is completed.

Winnipeg, Man.—A by-law has been passed by the city council for a vote of the ratepayers on the expenditure of $1,000,000 for extension to the hydro-electric system.

Brockville, Ont.—A by-law has been passed by the Council of Brockville for raising the sum of $69,000 for the improvement and extension of the present light and water systems.

Prince Albert, Sask.—The city will ask the Legislature to allow it to borrow $2,500,000 for construction work on the Lacolle Falls power plant, and to extend the time for completion for a period of three years.

Davidson, Sask.—The Canada Gas Producer Co., of Barrie, Ont., propose to instal an 80 h.p. gas engine and electric generator, together with a gas producer and other necessary equipment, for $8,500, in the town's power house.

Orillia, Ont.—The Water, Light and Power Commission, represented by J. B. Tudhope and C. H. Hale, has asked the council to consider a by-law to raise $80,000 for new machinery and equipment in the new power house to be built at Swift's Rapids.

Toronto, Ont.—It is definitely settled that the Provincial Hydro-Electric Commission will issue an order for the installation of street lights and house services in Swansea and Runnymede within the next month or two.

Winnipeg, Man.—The Winnipeg Electrical Railway has secured the Great Falls Power Co. waterfall on the Winnipeg River, situated midway between Lac Du Bonnett, the Electric Railway Co.'s present site, and mouth of river.

Hamilton Hydro Report.—The financial statement of the Hamilton Hydro-Electric Department shows a gross profit of $26,000, and a net profit of $6,000 for the past eight months. Engineer Sifton says $335,264 is needed to complete the system.

Nelson, B.C.—Construction work on the new units for the West Kootenay Power and Light Co., at Bonnington Falls, to supply power to operate the Rossland-Castlegar division of the C. P. R. will commence on January 1. The machinery has been ordered.

Ottawa, Ont.—Plans and description of the site of proposed water power development at High Falls, on the Madawaska River, in the County of Renfrew, have been filed at Ottawa. This is probably for the Ontario Hydro-Electric Commission.

Port Arthur, Ont.—The city solicitor has been authorized to prepare by-laws for the following: $8,000 for street lighting; $35,000 for street railway extensions; $35,000 for a telephone system; $50,000 for a high tension power line.

General Industrial

Berlin, Ont.—Arthur Forster, 123 King St. E., will build a twine factory. Plans are being prepared.

Quebec, Que.—"Le Soleil," a daily newspaper, suffered considerable loss to its plant by fire last week.

Revelstoke, B.C.—A company capitalized at $25,000 is being formed in Revelstoke to build and equip a new steam laundry.

London, Ont.—The factory of the London Bed and Mattress Co. was gutted by fire on October 27. The loss will total $30,000.

Winnipeg, Man.—The Canada Malting Co., Williams Ave., lost their plant by fire on October 28. The loss amounted to several thousand dollars.

Montreal, Que.—The Canadian Cereal & Flour Mills, Ltd., is in the hands of a receiver, and the mills may be turned over to their original owners.

Cardston, Alta.—A milk condensing plant capable of handling 22,000 quarts a day, will be built here. The Board of Trade has the matter in hand.

Edmonton, Alta.—The Public Works Department of the Alberta Government intends to construct a bridge over Saskatchewan Avenue at Eighth Street.

Berlin, Ont.—Gourlay & Fogelberg are erecting a shoe factory, costing $26,000.

Stanbridge East, Que.—G. W. Sadler & Co., are making an extension to their plant.

Cobalt, Ont.—The Dane Mining Co., working a copper property near Dane, on the T. & N. O. Ry., has lost nearly all its surface equipment by fire. Loss of about $5,000.

Toronto, Ont.—Fire did damage to the extent of $40,000 in the building at 39 to 43 Pearl Street, last week, occupied by Alexander & Cable Lithographing Co., Ltd., and others.

Revelstoke, B.C.—The Lakes, B.C., Canning Co. propose to build and equip a factory on Arrow Lake, south of Revelstoke, for the purpose of canning fruit and vegetables.

Vernon, B.C.—J. H. Christie has organized a syndicate backed by Kelowna capital, which will immediately open up coal properties on Short's Creek, about twenty-five miles from Vernon.

Beeton, Ont.—The Beehive flour mill, owned by Aitken & Son, was destroyed by fire Saturday, October 25. The loss is $13,000, covered by insurance. Recently new electrical machinery was installed.

Brantford, Ont.—On account of the lease held on the property expiring, James Workman has found it necessary to close up Workman's brick plant, which is to be offered for sale by auction.

Peterborough, Ont. — The Vermont Marble Co. expect to commence manufacturing operations this week in their new plant. T. M. Howard, Jr., is manager of the plant, and Mr. Holden, superintendent.

Fort William, Ont.—The elevator of the Ogilvie Flour Mills Co., Ltd., will undergo material changes in the near future. The shipping facilities will be enlarged to a capacity of 20,000 bushels of grain per hour.

Grimsby, Ont.—The Pelee Island Wine and Vineyards Co. will close its two plants at Sandwich and Pelee Island, and move everything to Grimsby. If given a bonus, they will erect, instal and equip a modern wine factory.

Sarnia, Ont.—Stuart, Limited, jam makers, are planning a new factory building to take care of their rapidly increasing business. They are contemplating the manufacture of new lines. Sarnia will probably lend them $15,000.

London, Ont.—Two new industries will come here within the next two weeks; one is an American concern with a capital of $40,000,000, who have secured an option on land along the London and Port Stanley tracks.

London, Ont.—The C. N. W. Shoe Co. may ask the city council to put before the electors a by-law in January, asking for a loan of $20,000 to enable the company to build a factory in this city; otherwise they will build elsewhere.

St. Catharines, Ont.—D. B. Hanna, vice-president of the C. N. R., has assured the council that work will be started right away on their branch of the Toronto to Buffalo line. They have given a bonus of $75,000.

Toronto, Ont.—Thomas Shortiss, proprietor of the Quaker Candy Co., has purchased from H. L. Wood the property at 422 to 426 Queen Street East, and will erect a four-storey stone and steel building.

Lethbridge, Alta.—The Rice Malting Co., or the Lethbridge, Alberta, Malting Co., Ltd., will erect a malting plant and elevator with a capacity of 350,000 bushels, costing $150,000. P. H. Rice, Winnipeg, is the owner. The plant will use 250 h.p. of electricity.

New Westminster, B.C.—The erection of a passenger depot on the south side of Columbia Street opposite Church Street and the construction of its line through the business section of the city on a double track trestle on a level with Columbia Street is planned by the Canadian Northern Railway according to preliminary plans of the company that came up for consideration at a special meeting of the council last week.

Montreal, Que.—On October 29 fire occurred in the Union Cold Storage building at Wellington and Colborne Street, resulting in a loss of approximately $100,000. The following firms suffered damage: The Industrial Mfg. Co., The Factory Waste and Metal Co., Dominion Machinery Supply Co., Canada Office Furniture Co., Canada Machinery Agency, and The Ives Modern Bedstead Co. All had adequate insurance protection.

Vancouver, B.C.—With their decision to form the Wall Street Waterfront Association, owners of property on the Inlet, between Trinity and Renfrew Streets, took the initial steps to develop their property for industrial purposes. The officials elected were: Alderman Woodside, president; Mr. H. G. Ross, vice-president; Mr. J. J. Taylor, secretary; Messrs. P. Mason, V. W. Heywood, Stuart Livingstone and A. C. Ray, executive committee. Several of the owners are in a position to start up some new industries.

Wood-Working

Dowe Creek, B.C.—Senator Edwards, Ottawa, and associates are preparing to build a large sawmill here.

Fanny Bay, B.C.—The Weeks Dunell Cedar Co. has been incorporated, and will build a shingle mill.

Vancouver, B.C.—The Joseph Chew Lumber Co. contemplates building a sawmill at Craycroft Island, B.C.

Saskatoon, Sask.—Frank Giddings is at the head of a Company who plan the erection of a furniture factory here.

Saint Martin, Que.—The Saint Martin Lumber Mfg. Co. has been incorporated by J. A. E. Decelles, J. W. Lavoie and others.

Thorold, Ont.—The new plant of the Beaver Board Co. will be running by next spring. Most of the machinery has been purchased.

Arkona, Ont.—The Arkona basket factory has been sold to River Bros., of Watford, who take possession immediately. It is understood that the factory will be much enlarged.

Goderich, Ont.—The Kensington Furniture Co., whose plant was burned down some time ago, are raising $20,000, and will build a factory three storeys high, 150 x 60 ft., and employ 100 hands.

New Incorporations

Ottawa Traction Co. Ltd., incorporated at Ottawa, capital $10,000,000, to construct or acquire, by lease, electricity at Ottawa. Incorporators: John F. Orde, Burns Moir, etc.

Napoleon Mill, Ltd., incorporated at Ottawa, capital $75,000, to exploit the Lauziere patent relating to wind-mills, at Drummondville, Que. Incorporators: Napoleon Garceau, Alexandre Mercure, etc. Drummondville, Que.

The W. W. Butler Co. Ltd., incorporated at Ottawa, capital $100,000, to buy, sell manufacture and deal in all kinds of railway apparatus, at Montreal. Incorporators: John Augustine Mann, Cecil G. MacKinnon, etc. Montreal.

Cobalt Reduction Co. Ltd., incorporated at Toronto, capital $350,000, to prospect for, open, explore, develop, work gold, silver, copper, etc., offices at Toronto. Incorporators: Armand Chenier, Pearl Stokes, ets. Toronto.

Coleman Fare Box Co. Ltd., incorporated at Toronto, capital $75,000, to manufacture fare boxes, and other appliances, at Toronto. Incorporators: Acton Burrows, William H. Knowlton, etc. Toronto.

Heinze Electric Co. Ltd., incorporated at Toronto, capital $50,000, to manufacture and deal in electrical apparatus and supplies, at Walkerville, Ont. Incorporators: Paul Butler, Butler Ames, etc. Lowell, Mass.

Atlantic Coast Steamship Co., Ltd., incorporated at Ottawa, capital $500,000 to build, equip, or otherwise acquire and hold ships and vessels, at Toronto. Incorporators: Reginald H. Parmenter, Arthur J. Thomson, etc., Toronto.

Scroggie Furniture Co., Ltd., Incorporated at Ottawa, capital $100,000, to carry on the business of manufacturers and importers of all kinds of furniture, at Montreal. Incorporators: Arnold Wainwright, Maurice Alexander, etc., Montreal.

Gray Pneumatic System, Ltd., incorporated at Ottawa, capital $500,000, to acquire and work inventions and patents for pneumatic systems of starting internal combustion engines, etc., at Toronto. Incorporators: John M . Duff, Frank Regan, etc. Toronto.

The Pierson Gas Producer Plant Co. Ltd., incorporated at Ottawa, capital $100,000, to import, manufacture and fit up the Pierson gasogenes, with motor and all necessary machinery, at Montreal. Incorporators: Pierre V. Rougier, Arthur Decay, etc., Montreal.

Van Buren Excavator Co. Ltd., incorporated at Ottawa, capital $75,000, to carry on the business of manufacturers of iron and wood-working tools and machinery, etc., at Toronto. Incorporators: William A. James Case, Harris, E. Wallace, etc., Toronto.

The Valleyfield Water Power Co., Ltd., incorporated at Ottawa, capital $1,000,000, to carry on the business of an Electric Light, Heat & Power Company in all its branches, at Salaberry de Valleyfield, Que. Incorporators: Noel A. Ostiguy, John Lowe, etc., Salaberry de Valleyfield.

Tenders

Welland, Ont.—The John Inglis Co., Toronto, are tendering on a 1,000,000 gallon pump required for the waterworks.

Ottawa, Ont.—The Public Works Department will call tenders shortly for the construction of concrete piers at Victoria, B.C., to cost $2,000,000.

Calgary, Alta.—Tenders are being received by the City Clerk until November 16, for a 1,000 K.W. Synchronus Motor-Generator and Exciter Set.

Salmon Arm, B.C.—The town clerk has been instructed to call tenders for the erection of a concrete oil tank for power house, to have capacity of 12,000 Imperial gallons.

Ottawa, Ont.—The tenders for the first section of the Halifax terminals for the Intercolonial Railway were opened last week, but were found unsatisfactory. New tenders will be called for.

Ottawa, Ont.—Tenders, marked "Tender for Section No. 5, Welland Ship Canal," will be received until Tuesday, November 18, 1913. L. K. Jones, Asst. Deputy Minister and Secretary, Department of Railways and Canals.

Ottawa, Ont. — Tenders endorsed, "Tender for Construction of Wharves at Victoria Harbor, B.C.," will be received until Tuesday, December 9, for the construction of wharves at Victoria Harbor, B.C. R. C. Desrochers, secretary. Department of Public Works.

Victoria, B.C.—The city council has rejected the bids for the telephone line and the street pressure pipe line of the Sooke Lake work, and decided to call for new bids, the city electrician to be instructed to also put in a bid on the work. The new bids will be both for the work as a whole and in part. The Water Commissioner and Consulting Engineer had recommended letting the pipe line work to the McDonald, Godson Co., of Vancouver, for a price of $444,998, but this was thrown out too.

Municipal

Fort Francis, Ont.—$12,000 for telephone purposes was finally passed by the council.

Todmorden, Ont.—Ratepayers are urging fire protection and a better water system.

Salmon Arm, B.C.—The council hope to secure $12,000 to complete the waterworks system.

Edmonton, Alta.—The city is building an asphalt plant to cost $5,000, two storeys, 27x53.

Sudbury, Ont.—The council will extend its water mains at a cost of $5,000. Clerk, George Elliott.

Peachland, B.C. — The Corporation will spend $1,000 on additions to the electric lighting system.

Welland, Ont.—The council is considering the supply of water to Crowland. The cost of the extension would be $1,500.

Hamilton, Ont.—The ratepayers will vote on a scheme to raise $200,000 for a new hospital, in January.

Toronto, Ont.—Works Commissioner Harris will again recommend the purchase of a stone quarry by the city.

Hull, Que.—The Hull City Council will begin at once the construction of the macadamized road between Hull and Gatineau Point.

Weston, Ont.—The Weston Water, Power and Light Commission have decided to lay a 4-inch water main on the north side of St. John's Road, at the request of the York Colonization Co.

Medicine Hat, Alta.—The city council will submit to the vote of ratepayers upon November 21st, a by-law for the appropriation of $50,000 to be used in grading and gravelling streets, and for the purchase of the plant and machinery.

Bow Island, Alta.—The municipal gas well at Bow Island, with a capacity of 10,000,000 cubic feet per day, has been completed. The money has been raised by local subscription, and free gas is being offered for new industries which wish to locate there.

Medicine Hat, Alta.—The ratepayers will shortly vote on the following bylaws: $50,000 for grading and graveling the streets; $12,000 for apparatus for fire department; $60,000 for building storm sewers, and $150,000 for extensions to light and power plant.

Winnipeg, Man.—C. F. Roland, industrial commissioner, has left for Great Britain, where he will take up the question of financing the proposed industrial buildings to be located on the old exhibition grounds. The scheme is to erect, in units, buildings to cost ultimately $10,000,000, the buildings to be used by small manufacturers.

Railways—Bridges

London, Ont.—The G. T. R. will build a line to Port Burwell as soon as possible.

Toronto, Ont.—The Metropolitan division of the Toronto and York Radial Railway will erect new terminals.

Medicine Hat, Alta.—The C.N.R. will start to build its line here next spring, and have the line to Hanna finished by 1915.

Toronto, Ont.—An electric railway from Toronto to Whitby is proposed, via Markham, Uxbridge, Brooklin and Port Perry.

Winnipeg, Man.— The city will soon ask the citizens for $150,000 with which to build a bridge over the Assiniboine River.

Vancouver, B.C.—The Railway Commissioners have approved plans for the southern approach to the Second Narrows bridge.

Hamilton, Ont.— Geo. F. Webb has been given permission to construct an incline at the head of Wentworth street to replace the present one.

London, Ont.—The proposed electric railway from London to Grand Bend is making good progress, according to the promoter, T. C. McAllister.

Owen Sound, Ont.—The Board of Trade has decided to ask the Hydro-Electric Commission to run a radial line from Guelph to Owen Sound.

St. Catharines, Ont.—The city council have passed a by-law authorizing an additional loan of $10,000 for the completion of the Ontario street bridge.

Saskatoon, Sask.—Plans and specifications are being completed by the C.N.R. for a pumping station in Saskatoon at an estimated cost of $15,000.

Ottawa, Ont.—In January, 1914, the residents of the town of Eastview will vote upon the question of extending the Ottawa Electric Railway line into Eastview.

Ottawa, Ont.—The Intercolonial Railway is about to award contracts for a large number of cars, which will probably go to the Eastern Car Co. and the Nova Scotia Car Co.

Toronto, Ont.—Frank Barber, engineer for York Township, has completed plans for a high-level bridge over the West Don River, alongside the C. P. R. viaduct No. 3.

Hamilton, Ont.—The C. P. R. has purchased a right-of-way through the south end of the city as a new route from Toronto to Buffalo. The cost of work in Hamilton will be $400,000.

Edmonton, Alta.—The Government is considering encouraging the Canada Central Railway and other lines to run lines into the Peace River district and Blindman Valley district near Lacombe, etc.

Vancouver, B.C.—O. S. Bowen, assistant chief engineer of the Great Northern Railway, states that the Company will shortly commence the construction of a viaduct over the Grandview cut on Commercial Street.

Ottawa, Ont. — The Ungava Railway Co. has given notice of application to Parliament for legislation authorizing the construction of a railway from the mouth of the Great Whale River, on the east coast of Hudson's Bay, to Aylmer Sound, on the Gulf of St. Lawrence.

Guelph, Ont.—The city council strongly favors a scheme for the construction of an electric railway from Hespeler, connecting with Puslinch Lake, through Guelph to Elora, Fergus and Arthur, and also from Arthur connecting with Mount Forest, through the Beaver Valley to Meaford or Thornbury.

Quebec, Que.—A proposition has been submitted by the Champlain Realty and Elevator Co. for the construction of a passenger elevator leading from the foot of Mountain Hill to the heights at Frontenac Park. The company, of which J. G. Scott is president, would have the elevator in operation by May, 1915.

Quebec, Que.—A tunnel will be drilled through the rock on which Quebec is situated. The tunnel will begin at Lampson's Cove, and will come out at St. Malo, near the site of the Transcontinental shops. It will obviate the alternative plan of connecting the sections of line east and west of the city by running a track around the congested water-front.

Winnipeg, Man.— Work on the new Provencher Bridge, which will cross the Red river diagonally, is being proceeded with rapidly. Number 6 pier has started and the contractors intend working through the winter, hoping to have the bridge ready for traffic by late next fall, when it will provide a direct route from the business centre of Winnipeg to the business centre of St. Boniface. A double street car track will be laid on the route.

Ottawa, Ont.—Notice is given in the Canada Gazette of applications from nine railway companies for legislation at the coming session of Parliament extending the time allowed in existing charter acts for completing lines authorized. The Companies include the Ottawa, Northern, & Western; the Manitoba & North-western; the Dominion Atlantic; the Tillsonburg, Lake Erie & Pacific; the West Ontario; the Thessalon & Northern; the South Ontario Pacific; the Glengarry & Stormont, and the C. P. R.

Three Rivers, Que. — Hon. Jacques Bureau, M.P., of Three Rivers, will apply to the Legislature for the incorporation of the Three Rivers Traction Co. for the purpose of constructing an electric railway in the city of Thre Rivers, and in a westerly direction to the town of Berthier and easterly to Portneuf, and generally through the whole district of Three Rivers, north of the St. Lawrence river. The incorporators are J. Aldred, Thomas McDougall, Howard Murray, Julian C. Smith, W. S. Hart, of Montreal, and Denis Murphy, of Ottawa.

New Incorporations

La Cie des Chargeurs Beaudry, Ltd., incorporated at Ottawa, capital $49,000, to manufacture wood and metal articles.

The Pierson Gas Producer Plant Co., Ltd., of Montreal, capital, $100,000. Incorporators—P. V. Rougher, A. Decary, A. de Montgaillard, Montreal.

The Goold Engineering and Supply Co. has been incorporated in Manitoba to carry on the business of civil, mechanical and electrical engineers at Winnipeg.

Marine

The Delta Dredging Co., with head office in Vancouver, has been incorporated with a capital of $100,000.

South Vancouver, B.C.—The council has voted $1,000 towards making plans for the improvement of the North Arm, which work will cost the Dominion Government $200,000.

Collingwood, Ont.—The Collingwood Shipbuilding Co. have secured the contract to build a large bulk freighter for the St. Lawrence and Chicago Steam Navigation Co.

Vancouver, B.C. — The Merchants' and Shippers' Steamship Line announces that if a reciprocal trade arrangement is reached between Canada and Australia, as now proposed, it will put on a line of vessels between here and Sydney.

Vancouver, B.C.—The design for a 15-inch hydraulic dredge for use on the Arrow Lakes, submitted by Cartwright, Matheson & Co., Vancouver, has been accepted by the Dominion Government. Tenders will be called soon for its construction.

Winnipeg, Man.— The Hudson Bay Co. announces an expenditure of $20,000 on the development of the far north of Canada in preparation for the great expansion expected when the Hudson Bay Railway is completed in two years. This money will be spent on steel clad steamers on Hudson Bay, and chains of trading posts across Canada.

C.P.R. Steamship Services. — The Canadian Pacific Steamship Lines announced officially on October 24, that T. McNeil, at present Antwerp agent for the company, will succeed to the position of Liverpool agent, left vacant by the death of F. W. Forester. Mr. McNeil has had a lifetime experience in maritime matters, having been employed by the Manchester Line for several years before his connection with the C.P.R. W. D. Grosset, for years Chief Assistant in the general European offices in London, has been selected to fill Mr. McNeil's post at Antwerp.

Contracts Awarded

Brandon, Man.—The Beaver Construction Co. have secured the contract to build street car barns costing $20,000.

Grand Forks, B.C.—A. E. McDougal has been awarded the contract to build a factory here, two storeys, 50x125, for the Grand Forks Canning Co. Machinery is being ordered.

Prince Albert, Sask.—Contracts have have let to Kilmer, Pullen & Burnham, agents, the Swedish General Electric Co., Toronto, for the supply of generators for La Colle Falls water power development.

Vancouver, B.C.—The B.C. Electric Railway Co. has awarded to Campbell Bros., a contracting firm of this city, the contract for the erection of the new passenger station at the south end of the Granville Street bridge.

Thor Iron Works, Ltd., of Toronto, have been awarded the contract for the standpipe at Timmins, Ont., by the Canadian Mining and Finance Co. The standpipe will be 20 feet in diameter and 95 feet high, with a total capacity of 225,000 gallons. Of this capacity, 50,000 gallons will be held as a reserve for fire protection purposes. The standpipe will be erected before the severe weather begins.

Saskatoon, Sask.—The city has awarded a contract to the Canadian Westinghouse Co. for two electrically driven pumps. The pumps will be supplied by the Turbine Equipment Co., Peterkin Bldg., Toronto, who are agents for De Laval pumps and steam turbines. One is a 6,000,000 and the other a 4,000,000 gallon pump, and both will be used for the filtration plant. The Canadian Westinghouse Co. supply the induction motors to run these.

Trade Gossip

Kingston, Ont., is organizing a bureau to secure industries.

The Guarantee Iron Works Co., Winnipeg, recently installed an oxy-acetylene plant.

Lachine bridge, built for the C.P.R. by the late Sir George Reid, of Newfoundland, is for sale.

Whealler & Co., machinists, braziers, etc., are supplying the foundry tools to the Northwestern Brass Co., Calgary.

The Mason & Risch, Ltd., piano makers, have increased their capital from $250,000 to $1,000,000.

Toronto Technical School.—There are 3,137 students registered at Toronto Technical School—660 in the day, and 2,477 at night.

The Manitoba Welding & Mfg. Co., Winnipeg, was the first firm to establish an oxy-acetylene welding plant west of the Great Lakes.

First Cycle Made.—The first motor cycle turned out by the recently organized Brantford Autocycle Co., appeared on the street recently.

Furniture manufacturers have this week been urging the Toronto Board of Control to give them a furniture building at the Toronto Exhibition.

Stocktaking.—The employees of the Waterous Engine Works Co., Brantford, have been enjoying a few holidays while the annual stocktaking took place.

O'Brien, Doughny, Quinlan & Robertson, contractors for section No. 3 of the new Welland Ship Canal, are opening offices on Chappel Street, Thorold, and not in Welland, as we stated last week.

Guelph, Ont.—The separator factory of the Raymond Manufacturing Co., and some of the other departments, are closed down for a week for stocktaking purposes.

The A. R. Williams Machinery Co., Limited, Front Street, Toronto, have moved their supply department and part of their machinery to the new location, across the street, in anticipation of work on the new Union Station and viaduct. The firm is under contract to vacate its building by January 1.

The Moffat-Irving Steel Works, Ltd., held their first general meeting on Thursday last. The following officers were elected:—James B. O'Brien, K.C., president; James W. Moffat, vice-president; T. C. Irving, jun., secretary-treasurer; other directors: W. H. Garvey and John J. Gibson, general manager of the Title & Trust Co.

The Turbine Equipment Co., Peterkin Bldg., Toronto, have been awarded contracts by the Ontario Government for De Laval centrifugal pumps, one with a capacity of 200 Imperial gallons a minute against 230 ft. head for the Hospital for the Insane, Penetang, and another of same capacity against 140 ft. head for the Hospital for the Insane, Orillia.

Nova Scotia Steel & Coal Co.—October was another record month in steel production for the Nova Scotia Steel & Coal Co. The output for the month was as follows:—Coal mined, 75,500 tons; coal shipped, 78,860 tons; iron ore shipped, 85,500 tons; pig iron made, 6,400 tons; steel ingots, 9,580 tons; steel billets rolled, 8,300 tons. The steel production and billets rolled constitute a record.

Housing Scheme for Guelph.—Houses at a reasonable rental are so scarce in Guelph that manufacturers have for some time past been at their wits' end to secure sufficient labor to run their plants. The Finance Committee of the City Council have taken the matter up, and it is likely that a Company will be formed to operate under the Public Utilities Act, whereby the municipality will guarantee their bonds to the extent of 80 per cent. The rate of rental, according to the Act, must not be more than enough to pay six per cent. interest

Information for Inventors. — Pigeon, Pigeon & Davis, patent solicitors of Montreal, report that 182 Canadian Patents were issued for the week ending October 14, 1913, 115 of which were granted to Americans, 25 to Canadians, 23 to Foreign Countries and 19 to residents of England and Colonies. Of the Canadians who received Patents, 12 were residents of Ontario, 5 of Quebec, 3 of British Columbia, 2 of Manitoba, 2 of Alberta, and 1 of Nova Scotia. In the United States, for the same week, 693 Patents were issued, 9 of which were granted to Canadian inventors.

Ashmead Gray Rodgers, for twelve years superintendent of The Carborundum Co.'s plant at Niagara Falls, died October 23, 1913, as the result of injuries sustained through an accident October 5. Mr. Rodgers had a host of friends and acquaintances throughout the mechanical and chemical world. He was a native of Albany, N.Y., having been born there in 1872, and previous to his coming to The Carborundum Co. as superintendent, was superintendent of the Eddy Electrical Co. at Hartford, Conn. His funeral was attended by several hundred of the employes of The Carborundum Co., members of the Niagara Club and other friends. Mr. Rodgers was a member of the American Chemical Society, Engineers' Club and Country Club of Niagara Falls, and several other scientific and social organizations.

Building Notes

Hamilton, Ont.—A by-law to raise $125,000 for city hospital repairs has been passed.

Peterboro, Ont. — The Government may build the new observatory here. There are certain objections to its being built at Ottawa.

Welland, Ont.—The Government has purchased twenty-three acres near the new canal to erect a hospital for the men employed.

Brantford, Ont.—The Building and Grounds Committee have asked Taylor & Bodley to prepare a plan of a city hall, costing $150,000.

Refrigeration

Quebec, Que.—The Quebec Abattoir Co. have been granted tax exemption of ten years by the city. They will go ahead and build now. Hon. J. E. Roberge, president.

Belleville, Ont.—The Belleville Cheese Board has decided to request the Government to assist the Steamship Companies in equipping terminals and steamers with cold storage plants.

Personal

R. B. Angus has retired from the presidency of the Bank of Montreal.

John Rodger Arnoldi, Toronto, mechanical engineer, who died September 12, left an estate valued at $33,829.

H. Wearn, of the Canadian Copper Co., Sudbury, has just returned from Europe, where he inspected several smelting plants.

C. W. Sherman, president of the Dominion Steel Foundries Co., Hamilton, is in the Maritime Provinces on a business trip.

Thomas C. Keefer, C.M.G., of Ottawa, has been elected an honorary life member of the American Society of Civil Engineers.

O. M. Perry, Belleville, has been appointed superintendent of hydro work in Windsor, Ont., at a salary of $150 a month.

J. Orr Callaghan, of the Steel Co. of Canada, was in Fort William last week on business connected with the new mill being erected there.

J. H. Plummer, President of the Dominion Steel and Iron Co., who is in England, visited the Cleveland district, and will also visit Germany.

Robert L. Clarke, electrician employed at the power house, Bobcaygeon, Ont., was the victim of a shooting accident on Tuesday last, while out hunting.

N. B. Wilkes, who has been at the head of the Watrous (Sask.) Electric Light, Power and Traction Co. since the time of its installation, has resigned.

Leonard Miller, B.A.Sc., son of C. J. Miller, of Orillia, has been appointed manager of the electric plant at Watrous, Sask.

H. Pottinger, for fifty years connected with the Intercolonial Railway, and ex-general manager, is now on a visit to Vancouver.

Thomas R. Deacon, president and general manager of the Manitoba Bridge and Iron Works, Ltd., is being urged to become Mayor of Winnipeg for a second year.

John A. Brown, a director of the Forth & Clyde & Sunnyside Iron Co., of Falkirk, Scotland, was in Vancouver last week. He is making a pleasure tour of Canada.

W. A. Bradbury, traveler for the Eagle & Globe Steel Co., Ltd., makers of tool steel, has returned from a Western trip, where he found things much improved in this line.

Charles Margerison has been put in charge of the City of Toronto marine plant. He will start with the building of a $15,000 scow. He was a diver for the city prior to this promotion.

S. H. Reynolds, at one time assistant city engineer of Winnipeg, has been appointed commissioner by the administration board of the Greater Winnipeg Water District.

William Armstrong, for a number of years chief boilermaker of the Michigan Central roundhouse shops, has resigned and accepted a position in the Grand Trunk shops at Bridgeburg, Ont.

Charles D. Winchester, storekeeper of the Canada Car and Foundry Co., New Glasgow, N.S., met with a serious accident on October 29, when a heavy steel girder fell upon him, crushing his leg above the knee.

Alex. Johnston, Deputy Minister of Marine and Fisheries, was married in Quebec City last week to Miss Fields, of Sydney, Cape Breton. Immediately after the ceremony Mr. and Mrs. Johnston sailed for England.

D. W. Clark, of the Canadian B. K. Morton Co., Montreal, is leaving Nov. 11 on an extended business trip. After visiting the Maritime Provinces, Mr. Clark will go on to Newfoundland, and from there he will cross over to England. He will be away about three months.

H. R. Wilkes, manager of the Fort William branch of the Canadian Fairbanks-Morse Co., was married on Wednesday, November 5, to Miss Bessie Smythe, of Toronto. On Monday Mr. Wilkes was presented with a silver tea service by the staff of the Toronto branch.

G. B. Harlock has been appointed manager of the General Supply Co., Adelaide Street W., Toronto, in succession to A. E. Juhler, who has been appointed manager of the Toronto branch of the Rudel-Belnap Machinery Co. Mr. Harlock was formerly manager of the machine tool department of the Ottawa branch of the Dominion Supply Co.

L. C. Randolph is resigning his position as advertising manager with the Canadian Fairbanks-Morse Co. in order to represent the Industrial and Educational Press, Ltd., Montreal, in the United States. Mr. Randolph will be their sole representative in the U.S.A., and will have his headquarters in New York city.

Samuel Terrell, after serving thirty-five years in the plant of the Raymond Manufacturing Co., makers of sewing machines, Guelph, Ont., was the recipient recently of a silver service. He is leaving for Victoria, B.C. For twenty years he has been foreman in the shops. H. L. Walker, superintendent, read an address, and J. R. Rife made the presentation.

Mr. Albert Skinner, who represents some half dozen leading firms of Sheffield, England, has been visiting Toronto and Montreal in the interests of his principals. Among other firms whom he represents are Richard W. Carr & Co., steel, file and tool manufacturers, who make the "Motor" high speed twist drill; Fox Bros., carpenters' braces, engineers' ratchet wrenches, pipe wrenches, parallel vises, etc.; Bennett & Farren, Ltd., power hammers, lathes, shovel rolls, etc.; D. F. Hogan & Co., saws, matchets, sugar cane knives, joiners' and bevel knives, etc. Mr. Skinner's present head quarters are at 491 St. Urbain Street, Montreal.

Obituary

John Allan, proprietor of the Ontario Nut and Bolt factory in Paris, Ont., died at his residence last Saturday, aged 74.

A. G. Rodgers, superintendent of the carborundum plant at Niagara Falls, and formerly of Toronto, died at his home in Buffalo, Oct. 23. The funeral took place in Toronto last Saturday.

Captain Harris, a native of Garden Island, near Kingston, Ont., passed away at his late residence, 40 Ritchie Ave., re-

Make this Force a Part of Your Selling Force

Advertising in the business press, properly directed, carefully planned, intelligently, forcefully and above all, truthfully written, will repay all time, thought and money you may devote to it.

It will produce direct results in any good medium. It will perform sales work (aside from inquiries by mail) upon which no estimate can be placed.

Only the outcropping of gold lies on the surface. The real wealth is hidden and requires digging to reveal it. Advertising is no different from any other gold mine.

It will continue to influence business long after it appears before the public.

It will strengthen and command respect for your catalog matter, and is often the barrier that intercepts the circular on its joy ride to the waste paper basket.

It will help your salesmen, and eliminates to a great extent the costly preliminary work salesmen ordinarily have to perform.

Advertising, should be on your sales force. If you have a good name and a good product, advertising ought to be employed to help you find a constantly widening market.

And if you are aiming to reach the machinery, metal working and engineering trades and industries, you can employ no more profitable or result-producing medium than "Canadian Machinery," the only journal serving this vast and fruitful field.

Rate Card and full information gladly furnished.

cently. The late captain, who was in his fiftieth year, had been in ill-health for some time. He had piloted several lower Lake Ontario steamers.

Thomas Monaghan, 412 Manct street, Montreal, died on Saturday, Oct. 18, aged 60. For 42 years he was employed in the foundry business. He was foreman with the H. R. Ives Co., and later became general manager of the Parker Foundry Co. For the past twelve years he had been manager of Mount Royal Foundry.

Alexander Jeffrey, a well known Montreal contractor and millwright, died suddenly in that city on October 30 at the age of 78. Mr. Jeffrey was born on the Island of Montreal, near St. Michel, in 1835, and had been in business in the city for the past fifty years as a millwright and contractor, and in that capacity had undertaken many of the best known engineering works in Montreal. He executed many Government contracts along the Lachine Canal and constructed the forebays and tailraces for several of the factories located there. Some years ago Mr. Jeffrey built the Lachine Hydraulic Works, now part of the Montreal Light, Heat and Power system. The work by which he is best known, however, and will long be remembered in Montreal was the construction of the Mountain Incline Railway, which was undertaken some fifteen years ago.

Catalogues

The Bennett-O'Connell Co., Chicago, Ill., have published a number of bulletins, neatly bound together, and dealing with the line of plating and polishing supplies which they make. The various items are illustrated and described, with sizes given in most cases.

The Department of Marine and Fisheries, Ottawa, has issued a Steamboat Inspection Report, which contains a list of all steamboat trading on the Canadian lakes and seaboard, and subject to inspection up to March 31, 1912. The name of each vessel, where employed, tonnage, etc., is given.

The Elliott Company, Pittsburgh, Pa., have published bulletin E, descriptive of the steam and oil separators made by them. Each type is clearly illustrated, showing the general construction, together with a comprehensive description of the method of working. Tables of dimensions are given for each type and size. Copies may be had by writing.

Feed Water Heaters made by the Elliott Company, Pittsburgh, Pa., are fully described in bulletin O which we have received. The various types made

A Business Man in Action

The business of the world is conducted by individual men. The motive power that accumulates fortunes, stimulates enterprise and keeps the industrial machine well oiled for the grinding out of food supplies to the peoples of the earth, is assuredly, in common parlance—brains. But brains differ in timbre. That is why a celebrated thinker said that the

Best Study of Mankind Was Man

In the current issue of MacLean's Magazine, the story of the Bordens—big men of both political parties in Canada, gives us studies of popular, successful and very human fellowmen. These character and family sketches are contributing mightily towards the interests of the readers. In the December number look out for the racy account of the Fighting Denisons of Toronto, a family who would not settle in the Queen City when it was proposed that

Toronto Be Called Dublin

The Germans who have aided the Kaiser in making modern Germany what a magnificent machine it is, are well described by Frederic W. Wile, Berlin correspondent of the London Daily Mail. MacLean's has the copyright. Ballin, just out, is timely. He is even now trying to make the German Empire a partner in the Hamburg-American Steamship Line. Bebel, the Red Napoleon, will be described in December.

In Fiction, the best stories are appearing. A short story by Cody relates how a

Lawyer is Beaten by a Boy

In our new serial, Spanish Gold, by George A. Birmingham, there appears a humorous story that will set everyone agog.

If this is not enough, take a look in December at:—

—The New Scrooge.
—Millions From Waste.
—Moving a University.
—A 1,000 Miles of Wealth.
—The Banking Situation.
—The Popular Book.
—Power That Serves.

And the unexcelled Review of Reviews Department in Canada's premier magazine.

by this company are carefully explained and the illustrations show clearly the general design. The principal features embodied in the design are dealt with and illustrated. This is an attractive catalog and copies may be had on request.

The Herbert Morris Crane & Hoist Co., Ltd., Toronto, have sent us a copy of bulletin A-10, dealing with type "S-4" hand operated overhead travelling cranes. Views are shown of several installations, including one of the Electric Light Co. plant at Sarria, Ont. The bulletin also contains a diagram, with table, giving the principal dimensions of each size. The Company have issued their monthly stock list of chain blocks.

The Gardner Horizontal Single-cylinder Air Compressors are described in circular A-C.5, which has been issued by the Gardner Governor Co., Quincy, Ill. The design and construction of the compressor is dealt with in detail, together with illustrations, one of which shows a cross section of the compressor, with explanatory notes. The bulletin concludes with tables giving the principal dimensions of each size, flow of air and compressed air data, etc.

Thermofeed is the title of a new catalog published by Ronald Trist & Co., Ltd., London, Eng., and describing the "Thermofeed" system of boiler feed regulation. A description is given of the "Thermofeed" regulator with instructions for installing. This is an attractive catalog, the illustrations being clear and in some cases colored, which heightens the effect. This is very noticeable in the colored sectional views which are very distinct. Copies may be had by writing.

Mather & Platt, Ltd., Manchester, Eng., have sent a copy of a new catalogue No. 50, describing their turbine pumps. A brief history is given of the Mather pump, together with a description of the various types. Views are

The Marten - Embree Co.
General Machinists
39 WENTWORTH ST. NORTH, HAMILTON, ONT.

UNDER THE WINDING-UP ACT.
IN RE THE STAR IRON COMPANY LIMITED.
In liquidation.
Foundry of 30 tons daily capacity.
For sale at auction.

The undersigned will sell at their rooms, 69 St. James Street, Montreal, on Thursday,

November 13, at 11 a. m.

the assets of the above estate as follows:—

Grounds, buildings, machinery, patterns, moulds and plant with rights in water power and leases, situated at Beauharnois, P. Q.

The patterns and moulds comprise, viz:—

A. Patterns and moulds for the celebrated "New Star Boiler" from No. 0 to No. 10, and all connections.

B. Patterns and moulds for the "Canada Improved" Radiators, 20 to 45 inches, plain and ornamented.

C. Patterns and moulds for Soil Pipe and soil pipe fittings in sizes 2-in., 3-in., 4-in. and 6-in. in light, medium and extra heavy.

D. Patterns and brass moulds for full assortment of the "Star" steam fittings.

The whole of the above to be sold en bloc, the purchaser to buy at cost price all material and goods manufactured, both at Beauharnois and at the warehouse, 1356 Cadieux Street, Montreal, consisting principally of "Star" Hot Water Boilers, parts and repairs.

Of the Star Boilers there are in actual operation 15,000. This should justify good and profitable results in the sale of parts and repairs.

All information can be had, and the factory can be seen in operation by addressing the Liquidator.

Marcotte & Freres **Alexandre Desmarteau**
Auctioneers **Liquidator**

Offices, Room B, 103 Farmer Bldg., Winnipeg, Man.

shown of high lift pumps, pumps working in mine shafts, and other installa-

The Mesta Machine Co., Pittsburgh, Pa., have issued a bulletin dealing with the Mesta gas engines. The principal features of the "Mesta" engine are explained in detail and the advantages set forth. The bulletin contains views of some large installations. Copies may be had by writing.

The Triumph Ice Machinery Co., Cincinnati, Ohio, have sent us a copy of catalogue E, which deals with the "Triumph" ammonia fittings, and covers the full line manufactured by them. Each style of fitting is illustrated, and tables giving the principal dimensions for each size and code words are also included. The catalogue is well got up, the tables and illustrations being neatly arranged.

Triumph Originality is the title of a set of two bulletins which we have received from the Triumph Ice Machine Co., Cincinnati, Ohio. The bulletins are numbered 501 and 511, the former dealing with the construction of the "Triumph" compressor and the latter with the "Triumph" shell brine cooler. Bulletin 501 contains a very full description of the construction of the compressor, with illustrations of various parts, showing some of the principal features. It contains also several outline diagrams, with tables giving chief dimensions of each size. Bulletin 511 gives a description of the construction of the "Triumph" shell brine cooler, together with data for installing and operating, also views of ice plants. These are very attractive bulletins, and the Company will be glad to mail copies by request.

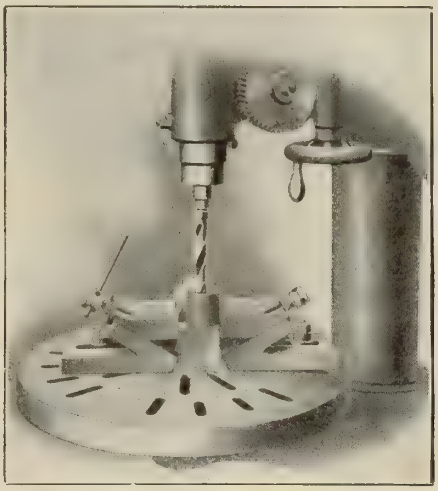
A Wonderful Vise



The S. & S. Divided Machine Vise

has unlimited capacity. It is suitable for use on practically any machine, and holds work up to full length of table. Holds Parallel, Taper and irregular articles—the lightest as well as the heaviest work. Has a combined parallel and downward movement of the jaw which forces the job down to the table, saves the operator the use of a hammer.
Get full particulars. Write to-day for Special Bulletin.

CASTINGS

DIE CASTINGS

Gas engine bearings, particularly the agricultural type, can be fitted with die cast bearings at a minimum expense, with the maximum efficiency in wear and ease of adjustment and replacement. An accuracy of .001 in. can be maintained.

Special booklet sent upon request.

LUMEN BEARING COMPANY
Brass Founders
WEST TORONTO

STEEL CASTINGS

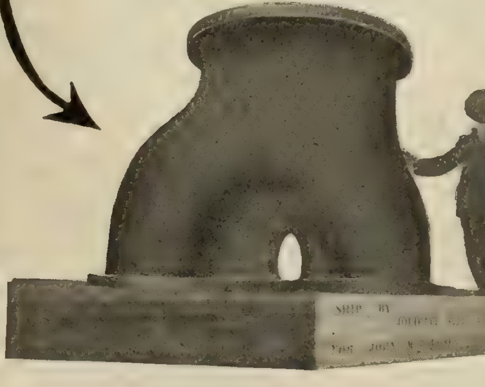
All Sizes, ¼ lb. to 30,000 lbs.

We make **New Process Converter Steel Castings, annealed and unannealed:** also **Chrome-Manganese and Nickel Steel Castings.**

Our Castings are perfect, yet they can be procured at a price that will ensure economy.

Every one guaranteed.

Ask us for estimates.

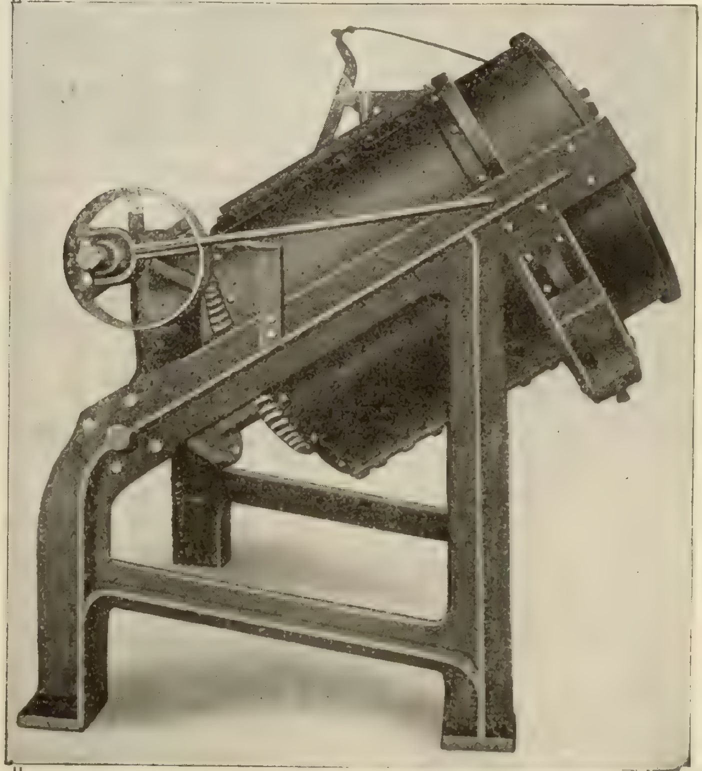


Casting for a 10,500 H.P. Water Wheel

JOLIETTE STEEL CASTINGS WORKS, Limited
Head Office and Foundry: JOLIETTE, P.Q.

The "No-Wear" Nozzle

An exclusive feature of the "Sly" and Satisfaction



And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

A Valuable New Book on an Important Trade

PATTERN-MAKING

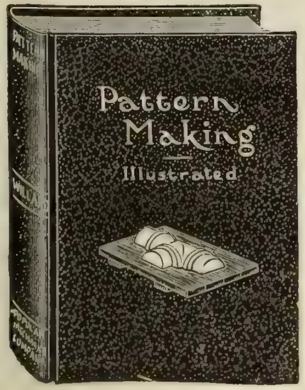
By G. H. WILLARD

Two Significant Opinions:

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co, Wilmington, Delaware.

224 Pages. 312 Illustrations. Cloth Cover.



With Additional Chapters on Core-Making and Molding

"WRITTEN SO YOU CAN UNDERSTAND IT."

A book for the man who does the work. Written by a practical patternmaker of many years' experience. Gets right down to business in the first chapter and keeps it up throughout the book. Full of kinks and actual working information. Profusely illustrated.

Chapter Headings

I. Pattern-Making as a Trade. II. The Tools. III. Woods. IV. Joints. V. Turning. VI. Turning (Continued). VII. Turning (Continued). VIII. Turning (Concluded). IX. The Circular Saw. X. The Circular Saw (Continued). XI. Machine Tools. XII. Machine Tools (Continued). XIII. Simple Patterns. XIV. Simple Patterns (Continued). XV. Simple Patterns (Concluded). XVI. Crooked Patterns. XVII. Large Pattern Work. XVIII. Large Pattern Work (Continued). XIX. Crosshead Guide Patterns. XX. Sweep Work. XXI. Pipe Work. XXII. Stove Pattern Work. XXIII. Molding—Machine Work. XXIV. Molding Pattern Work.

Part II.—Core-Making and Molding.

Chapter I. Core-Making, Simple and Complex. II. Principles in Molding. III. Loam Patterns and Loam Molds. Everyone following this trade, or intending to learn it, should have a copy of this valuable book.

Information Wanted!

¶ There may be some eminently successful and well known firms who have never advertised.

¶ But who are they?

¶ Any information leading to the identification of such a concern will be gratefully, if unexpectedly, received.

¶ Our object in seeking such information is a worthy one, because no matter how prosperous and popular a non-advertising firm may be, we can offer a plan that will make them still more successful and favorably known.

¶ We can think of several concerns who do not advertise, but they are not noticeably prosperous, nor are their names in the machinery hall of fame.

¶ Neither are their names in Canadian Machinery's Buyers' Directory, which is a very respectable hall of fame in itself.

¶ Take your time and think it over.

¶ It will take time and it is worth the thought.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

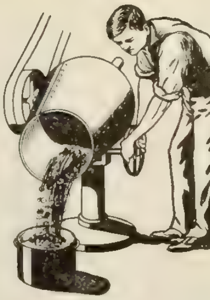
Globe Tumbling
Barrels



IN scientifically managed shops economy of motion and floor space are the keynotes of efficiency. In such plants you are almost certain to find

GLOBE TUMBLING BARRELS

You will see one man operating several barrels and doing the work better, faster and cheaper than it could be done by twice as many old-fashioned horizontal barrels.

The big feature of Globe Barrels is that one barrel will tumble many kinds of work. This is accomplished by simply changing the angle at which it is running. The work can be inspected without stopping, and the barrel filled and emptied while running.

These advantages alone make Globe Barrels worth your while, but there are many others equally important. Like to know about them? Then send for catalog No. 2 to-day.

8 stock sizes - - - $50 to $170

The Name

"Butterfield"

Represents Long Experience and Our Guarantee of Service

"Butterfield" Taps, Dies and Screw Plates give a service that means reduced tool cost for the shop.

They are carefully inspected before leaving our plant so as to prevent any defective tools from reaching the user.

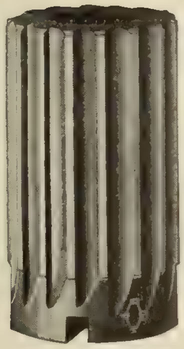
We advertise quality and we guarantee quality—once you have used the **"Butterfield"** tools you will use no other make.

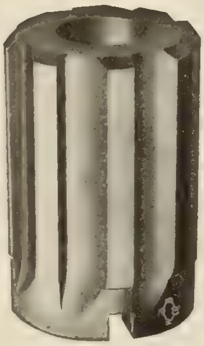
Our Catalog will be sent free upon request. Drop us a card for it to-day.

BUTTERFIELD & CO.

ROCK ISLAND, QUE. **DERBY LINE, VT.**

Cut the Yearly Cost of Reamers





You know what your present reamer bills amount to—try "W & B" Reamers, then watch the increased efficiency and reduced cost.

Our highly developed manufacturing processes and minute testing of raw material and inspection of finished tools has made "W & B" Reamers foremost in reamer quality. They give absolute satisfaction every moment of their use.

Jobbers and Dealers everywhere will furnish. If you are delayed in having your orders filled write us and we will see that you are supplied.

Ask for Machinists' Supply Catalog No. 82 P showing our full line of Carbon and High Speed Reamers.

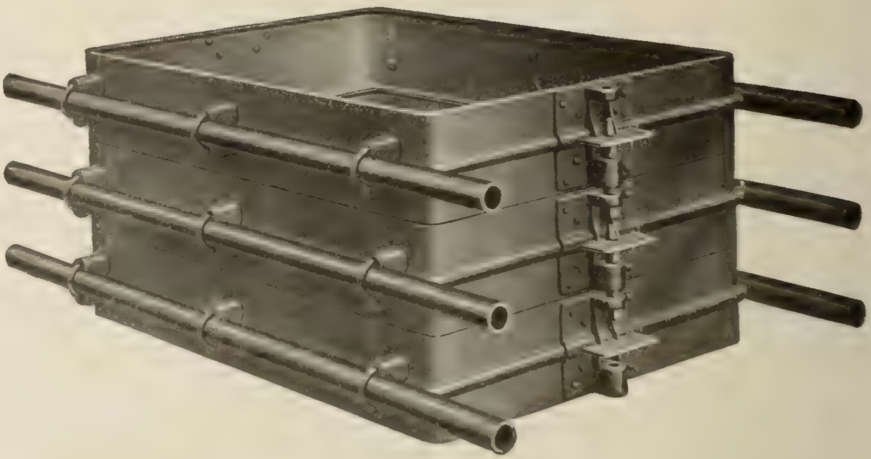
ECONOMY

in Foundry Equipment Use STERLING ROLLED STEEL FLASKS

They are made from special rolled steel, that combines lightness and durability.

Are without a peer for bench, machine or floor work.



Throw away your wooden flasks---they will burn.

Discard the cast flasks---they break easily.

Install STERLING Flasks They will not burn, break or spring. Various styles, shapes and sizes.

Extensively used by large foundries and manufacturers in Canada and the United States.

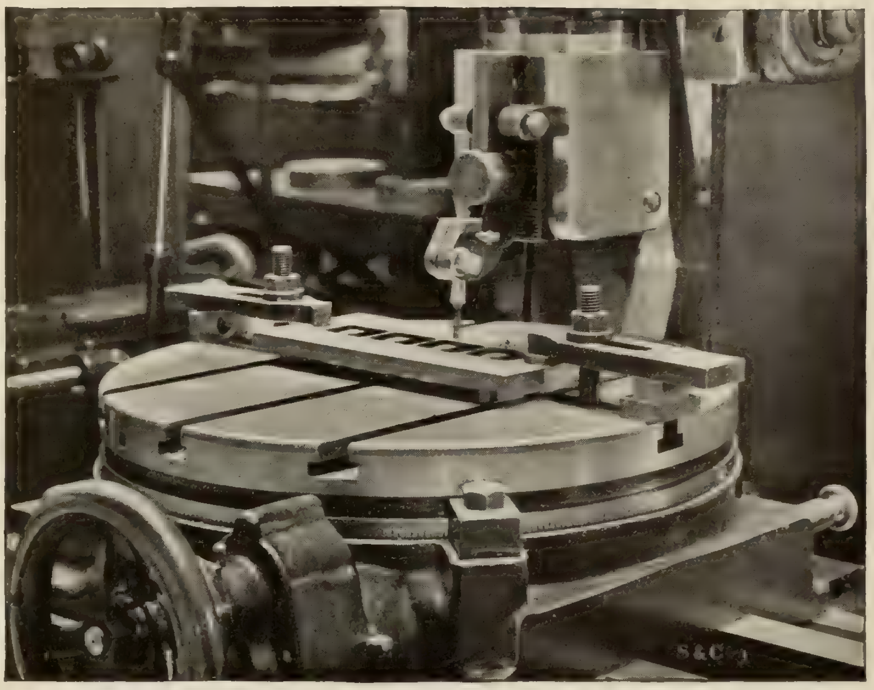
Builders of Machine Tools and Woodworking Machines

How Are You Machining Dies?



Showing P. & W. Vertical Shaper at work on punching die.

If you are interested in a cheaper and better method than you are now using, get familiar with the

P. & W. Vertical Shaper

It machines the die and cuts the clearance at one setting.

Especially Adapted for Finishing Punching and Trimming Dies.

One of the most distinctive features of the Vertical Shaper is the tilting ram bearing. This permits the tool to cut at an angle from the vertical and hence the desired clearance can be readily obtained.

Another advantage of the Vertical Shaper on die work is that when working to a line, the cutting tool always enters the piece where the line is scratched. Thus the line can be accurately followed. Furthermore, this shaper is a precision tool and accuracy, which is highly important in die work, is assured.

Write for illustrated circular and any further information desired.

The "Clipper" Belt Lacing

TRADE MARK

is more pliant than the Belt itself and just about as strong.

Each hook holds 50 lbs., or 350 lbs. to the Belt-inch.

Clipper
GRAND RAPIDS, MICH.

And a lacing is easily made in 3 minutes
by any man or boy without previous experience.

You save the time of the high-priced engineer or foreman and you cut the idle time of the machine or shaft to about one-quarter usual belt-lacing delay.

Clipper Belt Lacers and Clipper Hooks are now on sale by the following Canadian Houses:
Fleck Brothers, Ltd., Vancouver, B.C.; James S. Neill & Sons, Ltd., Fredricton, N.B.; T. McAvity & Sons, Ltd., St. John, N.B.; The James Robertson Co., Ltd., St. John, N.B.; Austen Bros., Ltd., Halifax, N.S.; Wood, Vallance & Co., Ltd., Hamiltin, Ont.; London Engine Supplies Co., London, Ont.; General Supply Co. of Canada, Ltd., Ottawa, Ont.; H. W. Petrie, Ltd., Toronto, Ont.; J. T. Wing & Co., Ltd., Windsor, Ont.; Williams & Wilson, Ltd., Montreal, Que.; F. H. Andrews & Son, Ltd., Quebec, Que.; General Supply Co. of Canada, Ltd., Winnipeg, Man.; General Supply Co. of Canada, Ltd., Toronto, Ont.

Clipper lacings hold longer, cutting down the frequency of belt-lacing delays. They also increase the pulling power of the belt.

Let us send you a Clipper for 30 days Free Trial. Particulars on application.

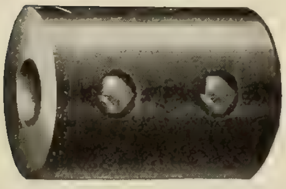
Grand Rapids, Mich., U.S.A.

SHAFTING COUPLINGS

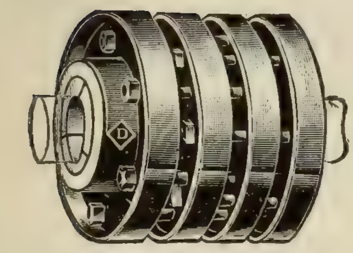


Solid Sleeve

DODGE SOLID SLEEVE

A low-priced coupling designed for light shafting, has countersunk set screws, and is finished over entire surface.

Single Compression



Double Compression

DODGE KEYLESS COMPRESSION

Built on the most liberal lines and calculated to furnish the manufacturing and supply trade with a coupling that can be had immediately from stock, and may be depended upon at all times to couple shafting without keyseating or keys, thus affording ease and despatch in erecting at a minimum cost. Made in two styles, Single and Double Compression. For shafting up to 2 7-16 inch diameter, we recommend the single compression coupling for ordinary duty. For larger shafting, we recommend the double compression coupling.

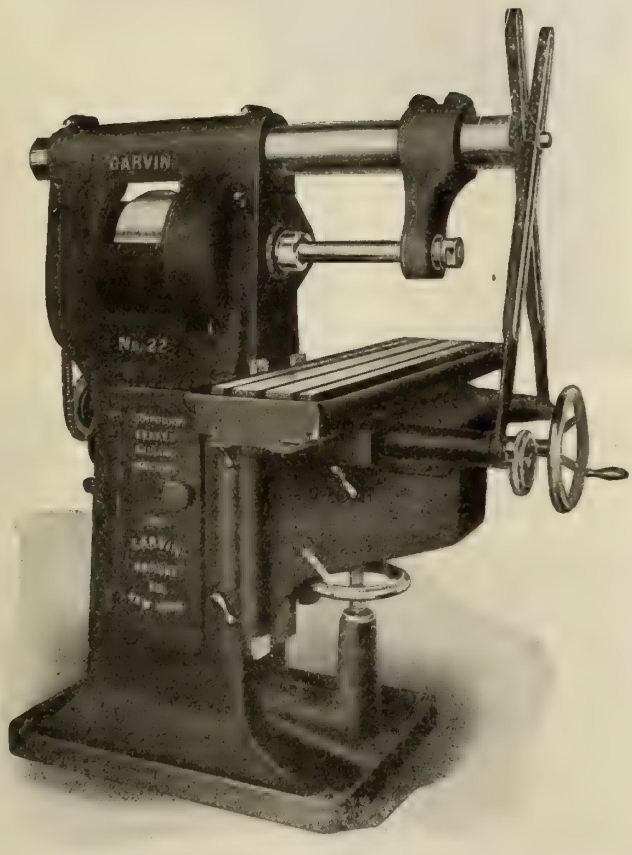
MOST POWERFUL MILLING MACHINE

(Knee Type)



GARVIN No. 22, Plain Milling Machine Compound-Geared. Use Code, "Aperient"

The machine shown is the most powerful Knee Type Milling Machine manufactured by us, having Compound Back Gearing whose ratio is 10 to 1, through steel gears. It will transmit 10 horsepower to 14 inch cutters, running 20 revolutions on steel castings. The machine has a wide faced pulley of 11 inches in diameter, running loose on the spindle. The power is taken from the countershaft by a 6-inch double belt to this pulley and double-backed-geared back to the spindle. The machine has an arbor 2 inches in diameter, solid, with spindle, thus avoiding a lot of arbor troubles.

DIMENSIONS

Length of automatic feed of table	28 in.
Dimensions inside of oil pockets	43½x9 in.
Vertical adjustment	15½ in.
In and out adjustment	7 in.
Crated weight	3250 lbs.

TAKE THIS GRINDING JOB FOR INSTANCE

GRINDING HIGH-SPEED STEEL WORM-GEAR MILLING CUTTERS WITH AN

ALOXITE GRINDING WHEEL

BECAUSE of the various surfaces to be ground and their sharp edges, the wheel must be of just the right grit—the proper grade to hold its cutting face without becoming grooved. ¶ Then, too, the wheel must cut fast and clean without burning the tool. ¶ And it must stand up to the work—holding its size so as to give a positively parallel cut—a close study of these grinding conditions enables our service department to give just

The Right Wheel in the Right Place

It is the wheel plus the service. We can give you both.

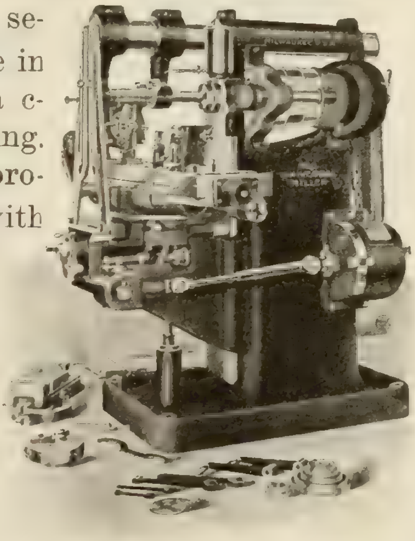
The KEMPSMITH MASSIVE KNEE



helps the milling machine to **stand up** to steady, severe service in manufacturing milling. Generous proportions, with abundance of metal thrown where it is most needed—for instance, around the bearings on the column. See also the length of these bearings. The whole machine is built along the same massive lines.

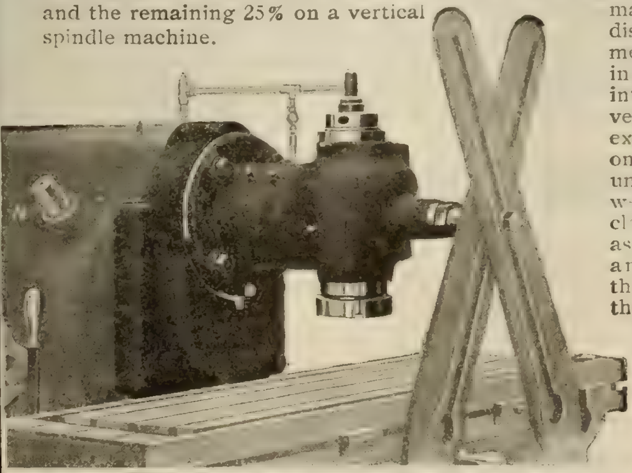
Built in "The Model Plant for Specialized Machine Manufacture."

KEMPSMITH MFG. COMPANY, Milwaukee, Wis.

WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 14—Vertical Spindle Attachment

Roughly speaking, 75% of all milling can be performed to best advantage on a horizontal spindle miller and the remaining 25% on a vertical spindle machine.



But a large percentage of work ordinarily performed on a vertical miller can be done just as well on a horizontal machine with vertical spindle attachment, provided the attachment is properly designed to form a rigid and effective unit with the machine.

The vertical spindle attachment for Milwaukee Millers embodies all the advantages of the vertical spindle machine except throat distance. It is so dimensioned that all tools in the horizontal spindle interchange with the vertical spindle. By extending the dovetail on the face of the column up to the overarm, we make it possible to clamp attachments such as this to the machine and secure practically the same rigidity as though the attachment were actually cast as part of the machine.

Our vertical spindle attachment offers the added advantage that the spindle can be set at any angle with the table, graduations in degrees being furnished for this purpose.

In any shop where the amount of work does not warrant installing both vertical and horizontal millers or where it is more desirable to have one very flexible machine rather than two separate machines, Milwaukee horizontal—spindle Millers with this attachment will serve admirably.

We were the first and for many years the only manufacturers to furnish a vertical spindle attachment in which all tools would interchange with the horizontal spindle and we have improved our attachment from time to time so that today it is well on a par with the excellence of our machines.

Knowledge of the complete "WHYS" in favor of Milwaukee Millers and their attachments is decidedly valuable to the milling machine user. You get this knowledge by writing for our Bulletins.

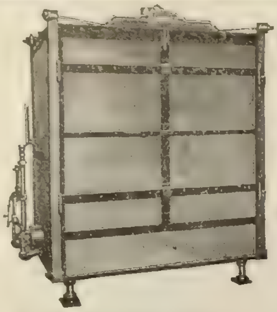
THE CRAWFORD SECTIONAL OVEN
PAT'D NOV. 20, 1906
THE OVEN EQUIPMENT AND MFG. CO. NEW HAVEN, CONN.



Standard Type B. Sectional Oven

Small Barrel Oven for Bluing

The Oven Question Need Not Worry YOU

The experimental stage is long past and you can feel perfectly secure with your results if you obtain them by means of

CRAWFORD Sectional Ovens

Built for all purposes and processes, these ovens are giving thorough satisfaction and earning many repeat orders for work in baking, bluing, enamelling, japanning, lacquering and drying generally, as well as the annealing of small metal parts. Circulation is thorough and absolute. Temperature regulation may be made as close as you desire. Attendance is practically nothing. Insulation is so good that heat leakage is a minimum. The question of safety is cared for by an **automatic shut-off valve** and by the use of our famous patented **Enclosed Flame Gas Burner.**
If the oven question has been worrying you, let us know what your problem is, and we will show you how the worry can be killed. In the meantime let us send you our catalog C, describing and illustrating ovens of all types and sizes.

CLEVELAND SAND RAMMERS

FOR FLOOR, BENCH, PEIN AND FLASK RAMMING.

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Ramming in general foundry service.

The Piston Rods are packed with a resilient packing that conforms to the shape of Rod without retarding its free action, and prevents any dirt from entering piston chamber and working parts—Rammers are fitted with either Round or Flat Rods as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

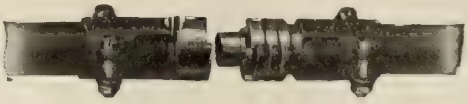
CLEVELAND CHIPPING HAMMERS

For General Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are particularly adapted for fast chipping now required by piece-work operators.

BOWES AIR HOSE COUPLINGS

Over 1,000,000 in General Use.

Bowes Couplings are instantly connected or disconnected.



Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

In Stock: — RIVETING HAMMERS, DRILLS, REAMING, TAPPING AND FLUE-ROLLING MACHINES, CORNER DRILLS, PORTABLE AND BENCH GRINDERS, ETC.

Catalog No. 12 mailed on request.

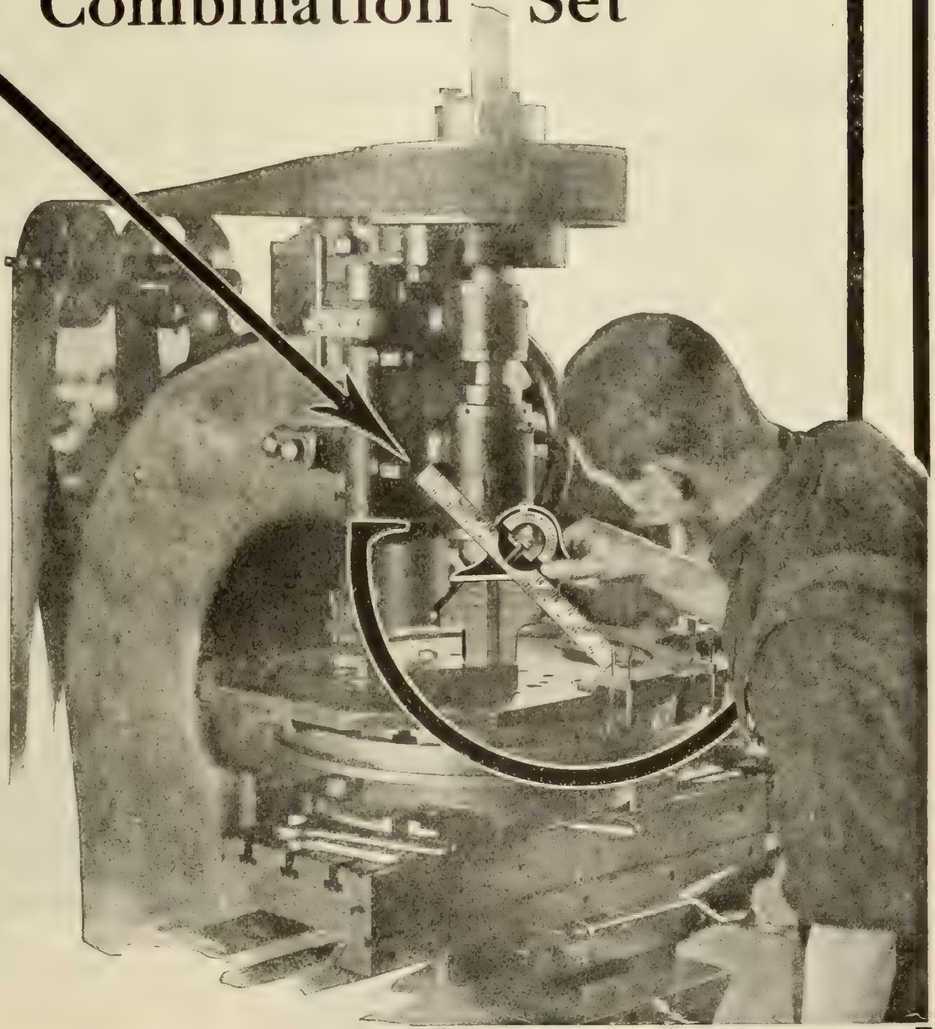
One Efficient Instrument

Replaces Seven Ordinary Tools

Too good to be true? Not at all. It is a fact. This machinist is testing his work, using the Combination Set as a protractor. But he can slip on a centre head or a square and use the instrument to centre round work or as a try-square or bevel then he can use the rule separately. In short this tool does the work usually requiring a rule, square, level, protractor, bevel, centre head, and depth gage. It does not sacrifice the accuracy of the individual tools to obtain this convenience. And think of the room it will save in the tool box.

STARRETT

Combination Set



No machinist's outfit is complete without this Starrett Combination Set, but do not stop when you have the Combination Set. There are lots of other time-saving tools in the Starrett line. The Starrett Quick Adjusting Micrometer may be just what you are looking for to save time in making frequent micrometer measurements. Other tools will accomplish as good results in their line as the Combination Set does in its field.

Let us send you our free catalog 203 which describes the full line of Starrett tools. Write now.

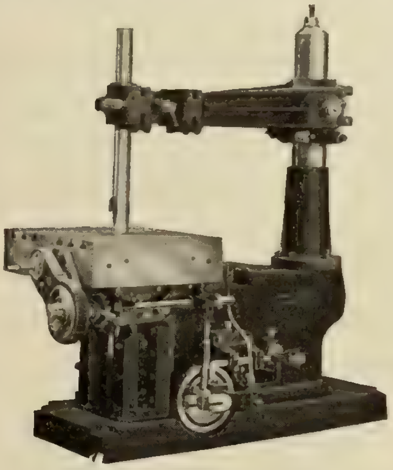
ACCURACY

There may be a sameness of appearance in Cap and Set Screws, but a vast difference in their use. No waste nor lost time when you use "Galt" screws, hence more production at no greater cost. Buy "Galt" and cut out the loss.

Want a better finished S F Hex Nut? Try "Galt" and be satisfied.

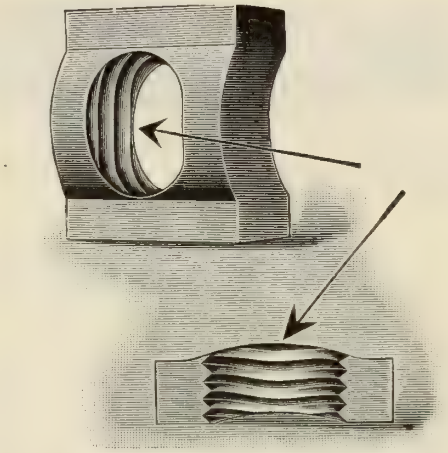
THE
GALT MACHINE SCREW CO., LIMITED
GALT, ONT.

Keyseater and Slotter



Will cut keyseats, internal gears, internal ratchets, oil grooves, miscellaneous slotting, etc., more accurate and quicker than any machine on the market.

Baker Brothers, Toledo, Ohio.



This cut shows an exaggerated curve in thread pitch—or more (in order to emphasize this feature) than is given in practice.

Throw Away Your Keys and Cotter Pins

There is now no longer any need for them. They were good in their day, but have fulfilled their mission. The world moves and there is now a better way to keep nuts on.

The Grip Nut is the device to do it with. It requires no hole, slot or other change in the bolt and does away with the necessity for cotter pins, keys or other auxiliary fastenings.

The Grip Nut can be removed and put back on again without injury to the threads of either the bolt or nut. It starts easily with the fingers, and then can be tightened with a wrench.

GRIP NUTS

Are being used by the millions on all kinds of machinery, elevators, conveyors, concrete mixers, steam shovels, bridge construction, motor trucks, automobiles, pumps, agricultural implements, etc. They are also being used in vast quantities by the leading railroads.

Universal use is the surest indication of satisfaction.

The secret of the efficiency of the Grip Nut is in the arch, and it is by means of this arch that the thread deflection is given, which enables the Grip Nut to lock on the threads of the bolt.

Manufacturers of machinery, from which it is important that nuts should not lose off, are now using Grip Nuts instead of the old style cotter pins and split keys, or double nut practice.

Grip Nuts are made in all sizes, square and hexagon.

We will cheerfully send catalogue and sample nuts on request. Mention size of bolt.

THE TOLEDO ELECTRIC WELDER COMPANY

CUMMINSVILLE, CINCINNATI, OHIO

The World Changes As We Change

¶ A few days ago a man who insists on taking a squint at things through the wrong end of the telescope and looking at life through a fog, complained that we are living in a very bad age of the world and that it costs a great deal more to live now than it did a generation or so ago.

¶ The price we pay for a thing, as a rule, is a pretty fair index to its actual value. This principle, however, does not apply to the escapades of the "cigarettist," the man who cultivates the "poker face," and a certain contingent which "hits up" the after-theatre cafes, seeking the attention of "bell-boys" and "powdered flunkies."

¶ Yes, it costs more and is worth more. The fact of the matter is—the world has been fitted out as a respectable place to live for only a comparatively little while. If we desire to abolish the comforts and pleasures of life we can live just as cheaply now as did our forefathers in the "good old days" gone and forgotten.

¶ We live more now than we did a generation or so ago: We have more happiness, more freedom, more money—better food, better health, finer clothes, better salaries, finer homes, prettier flowers and gardens, more parks, better buildings, less sickness, more fresh air and out-of-door sports, more conveniences, finer music, wider and more extended travel and better understanding and contact with each other and with the rest of the world.

¶ The fact of the matter is, we are a wonderful people living in a wonderful age, and when we come right down to the last analysis, this is a mighty fine world after all. It is the only one we have ever seen and certainly is as good as we deserve. Surely, it is a strange man who can complain about a world wherein there are such splendid opportunities and such wonderful facilities for pleasure and happiness.

¶ During the last fifty years we have made the world over anew. The fact that it was not a very good world in which to live until a few generations ago was man's fault. The world changes only as man changes. The agencies of energy which we have harnessed and applied have been here since the beginning of time, awaiting the magic touch of intellect.

¶ Not so many years ago Congress refused an appropriation to establish a telegraph line, on the ground that it was the proposal of a "deluded and insane man." One Congressman said that "money may as well be appropriated for building a railroad to the moon." This man did not live to send home a night lettergram, but his children have, and the other day a sort of telephone arrangement was installed in one of our great cities, whereby it is possible to sit at home in a Morris chair and have the news of the world given us just as quickly as it becomes news.

¶ Then, the point is—if there is something wrong, if you have cause to complain—there is work for you to do. Simply "get right" with the world—live, laugh, WORK and be glad.

INDUSTRIAL NOTABILITIES--No. 8

NATHANIEL CURRY

NATHANIEL CURRY, President of the Canadian Car & Foundry Co., and other numerous important corporations, is one of Canada's really big self-made men, and one whose success is all the more meritorious, as he was not born with the proverbial silver spoon in his mouth, but rose in the world by his own ability, and made a fortune for himself because he had the ambition, the energy and acumen to do so. Receiving but an ordinary common school education in King's County, N.S., supplemented by a course in a business college in the Western States, he apparently had no show with the college-bred youth, but his subsequent career proves that the higher education was not necessary to the welfare and success of a young man of determination, ambition, health and ability, and so the subject of this brief biography succeeded where many failed.

Nathaniel Curry was born March 26th, 1851; a son of Charles Curry, a farmer of Scotch-Irish descent, and Eunice (Davidson) Curry, of English ancestry. At the age of 15 young Curry started to learn the woodworking business, and four years later went to Boston, Mass., remaining there for a period of one year. He then crossed the continent seeking his fortune at a time when there were many hardships to endure, and from 1872 to 1877 he worked at his trade at Carson City, Nevada, with the Virginia & Truckee Railroad as assistant foreman and millwright in shops. This position he retained until 1877, when he went to Amherst, Nova Scotia, and founded the firm of Rhodes, Curry & Co., which has since become well-known throughout the Dominion.

NATHANIEL CURRY.

In 1893 the company was incorporated and bought the car business of J. Harris & Co. In 1909, together with the Dominion Car & Foundry Co. and the Canada Car Co., the Rhodes, Curry Co. were merged into the corporation known as the Canadian Car & Foundry Co., the largest car concern in the Dominion. Mr. Curry was chosen as its President, which position he still occupies.

Mr. Curry is also President of the Canadian Steel Foundries, formed 2 years ago. He is a director of the Canadian Light and Power Co., of the Bank of Nova Scotia, of the Montreal Trust Co., of the Canadian Coal & Coke Co., of the Travellers Life Insurance Co. of Montreal, of the Maritime Coal, Railway & Power Co., and various other corporations in the Dominion of Canada. He is a member of the Mount Royal, The Engineers', The Canada, The Royal Montreal Golf, and The Caledonian Curling Clubs of Montreal; of the St. Andrew's Society, and of the National Club, of Toronto. He was married Sept. 17th, 1881, to Mary Hall, of Amherst, Nova Scotia, and they are the parents of five sons, Victor G. Curry, Eric M. Curry, Leon H. Curry, Ivan Curry (deceased), and N. R. Curry.

Mr. Curry occupied the office of President of the Canadian Manufacturers Association two years ago.

The Manufacture of Electrically Welded Chain in Canada

By L. B. Powell

Chains, like ropes and belts, fill a large place in the industrial, manufacturing, shipping and commercial world generally, and so far as the necessity of reliability for a definite service is concerned, they come first in importance. The accompanying article deals with a plant and process which have for their object the production of each link joint with an efficiency of 100 per cent. of the solid bar.

IN order that the development which has taken place in the chain industry of Canada during the past few years may be more clearly understood, it will be in order to give a brief description of the manner in which chain is made under the fire-welded process.

The equipment of a chain manufacturing plant under the latter process consists principally of coiling machines, cutting machines, forges and hand or power hammers. The material is coiled into a long spiral and cut into separate links under a cutting press, the spiral being fed into the press in such a way that each link is cut across with a scarf at an angle of about 45 deg. These links are taken to the chain makers and brought to a welding heat in either a combination gas and hand furnace or in a coke forge. A number of links are heated at the same time, and as fast as one comes to a welding heat, it is taken from the fire and the scarfed ends pounded down under the blows of a hand or a power hammer.

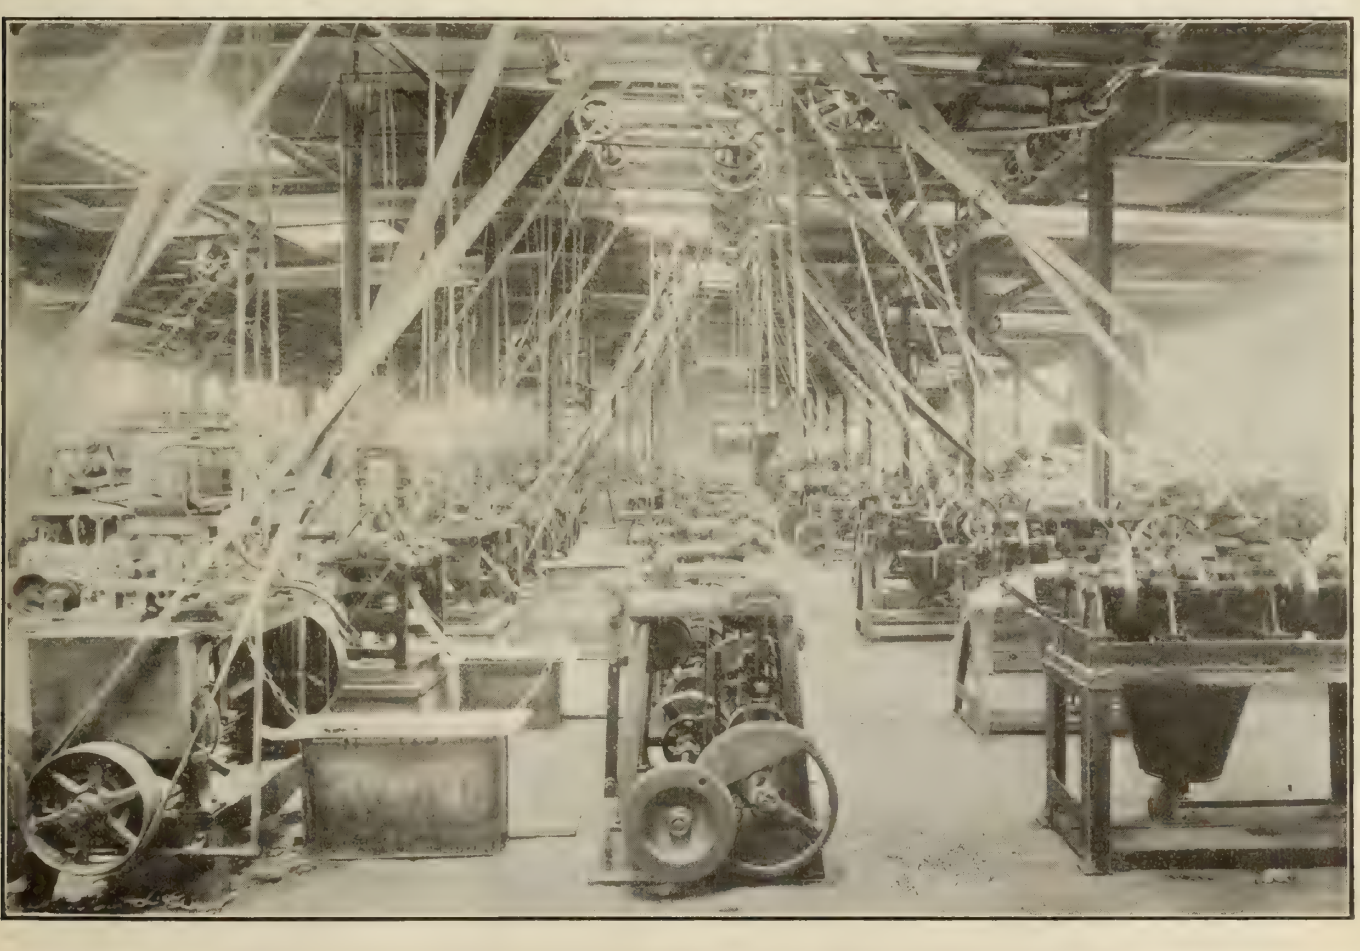
This method of manufacture as regards quality, depends entirely upon the fidelity and skill of the workman, who usually is paid a piece-work price that makes it necessary for him to weld a very large number of links per day. Owing to the rapidity of action required, there is often a large percentage of links either heated too much and thus burnt, or not heated enough so that a perfect weld cannot be made. In addition, there is always the possibility of dirt from the fuel getting between the scarfs of the links, thus preventing a perfect junction of the metal.

Electric Welding a Modern Improvement.

The electric welding of chain is a modern improvement, made necessary by the evils existing under the old style of manufacture. Chain, above all other products, needs the strength that is obtainable only by perfection of welding, and the invention of the automatic welding process is the result of experiments continuing over a long period of time with a view to finding a method of forming and welding links that would result in every weld being absolutely perfect.

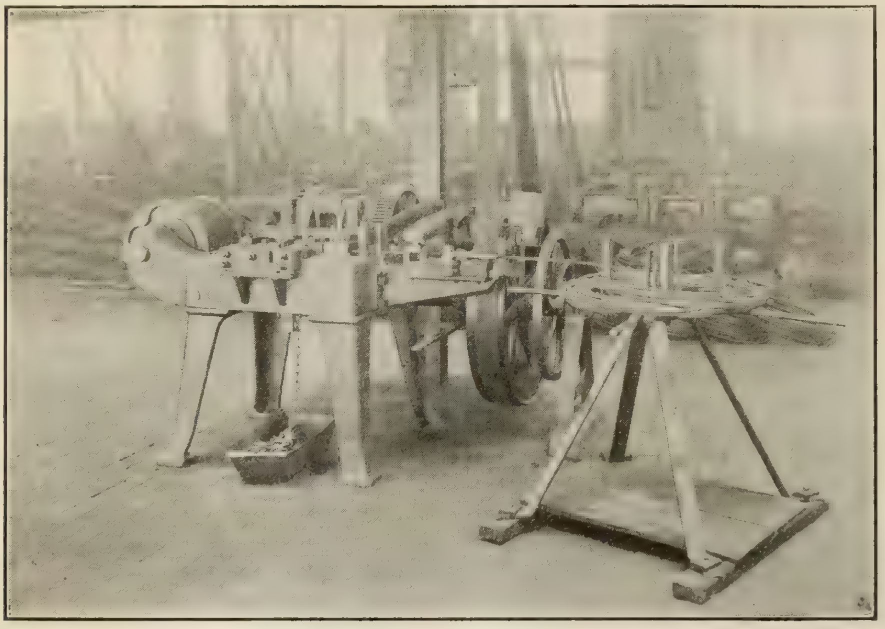
The machines illustrated herewith are not the product of a chance thought, but are the result of a long study and expensive experiments resulting in continuous improvements, all of which are fully protected by patents in Canada, Great Britain, United States, and several European countries.

The plant of the McKinnon Chain Co., located at St. Catharines, Ontario, is of modern fireproof construction throughout, and is thoroughly lighted and ventilated. It can be seen at a glance that it is filled with expensive automatic ma-



GENERAL VIEW OF THE McKINNON CHAIN CO. PLANT, ST. CATHARINES, ONT.

chinery capable of turning out a very heavy tonnage of chain. The company has a similar plant at Buffalo, N.Y., for its United States business.



CHAIN FORMING MACHINE.

Manufacture of Butt-Weld Chain.

The first operation in the manufacture of butt weld chain is that of bringing the chain into unwelded links on the forming machine shown herewith. The coils of wire are fed into the machine from a spool, and the operation of the machine is entirely automatic, linking the chain together ready for welding as shown. From the forming machine, the unwelded chain is fed directly into welders of the type illustrated, the operation of which is also entirely automatic.

Owing to the fact that alternate links present themselves for welding with the opening at different angles, these welders are constructed with two heads, so that the first head will weld every other link, and the second head will weld those in between; the chain being twisted between the first and second heads so that the link will be presented to the jaws of the welder in the same position. This arrangement is one of the Patented features of these machines.

The electrodes of the welder meet the material on each side of the joint, and, while the current is passing across the joint, the link is being given compression at the ends so that a junction of the material at the welding heat is being effected. The heat is developed by the passing of a large volume of current at a very low pressure, 2 to 3 volts. The pressure is so low that the current cannot be felt even with both hands on the electrodes, while the volume is so great that ½-in. links come to a welding heat in 5 seconds, and it requires a conductor or lead 8 inches square of pure copper. A curious fact about copper used for such purpose is that one per cent. of impurity reduces its current carrying capacity by 33 per cent.

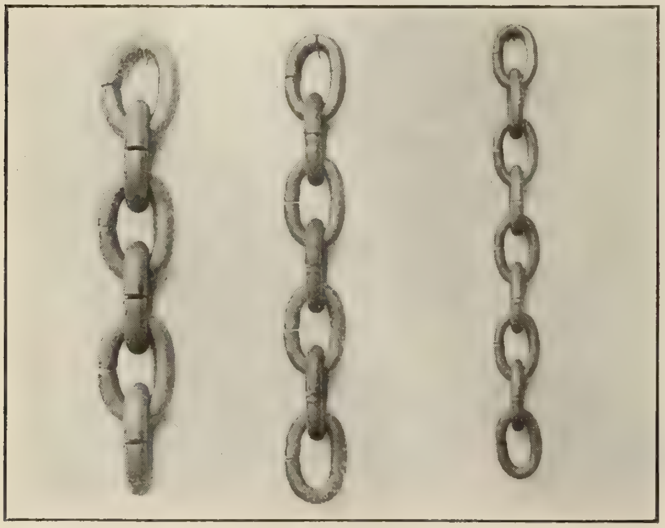
These welders are entirely automatic, with the pressure and current regulated so that each link receives exactly the correct amount to insure a perfect weld. This does away with the uncertainty of fire welding, where the perfection of the weld is subject to the chances of want of skill or care on the part of the workman, burning or insufficiently heating the steel, and of dirt or sulphur in the fuel.

One of the illustrations shows several sizes of chain just as they come from the welder and indicates clearly the swell at the weld which is a feature of all McKinnon products. This swell is a natural result of the process of manufacture, and while it could be reduced so that the weld would be equal in diameter to the balance of the link, such a reduction would not only take away the extra strength where most needed, but would have a tendency to weaken the weld mechanically, and, in both ways, would reduce the quality of the product.

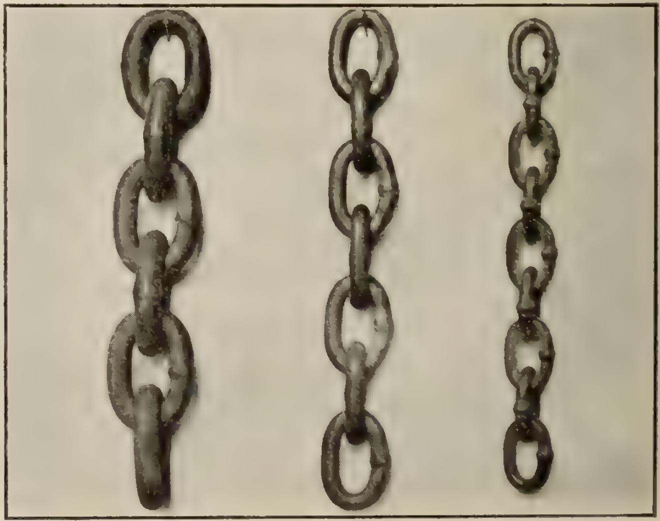
The swell at the weld does not interfere in any way with the use of the chain for practically all purposes, and a great many tests have proven absolutely that the reduction of the weld would mean a decrease of almost 50 per cent. in the strength and wearing quality of the chain.

Test Features.

While records show that over 99 per cent. of the product of these automatic welders is perfect in quality of welding, yet nothing is omitted that will produce as near to 100 per cent. perfection as possible. For that reason, every link of chain is carefully inspected after it leaves the welder, and any links that show evidence of imperfect welding are at once cut out, and the chain passed to the hand welder to be joined together before being tested. In the manufacture of electrically welded chain, because the pressure and current are regulated automatically, nothing is left to chance or to the skill of the workman.



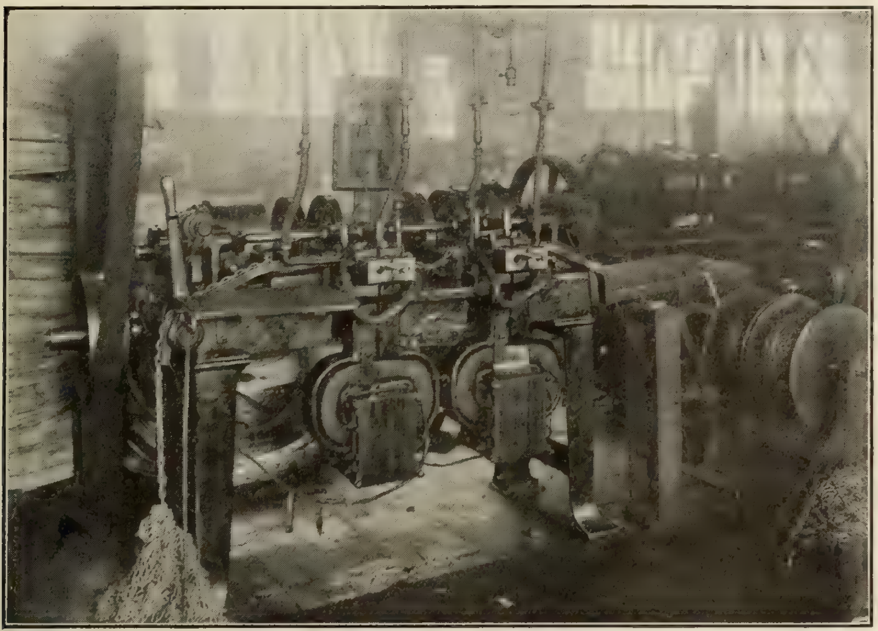
CHAIN FROM FORMING MACHINE READY FOR WELDING



ELECTRICALLY WELDED CHAIN SHOWING SWELL WELD.

FACTORY AND WORKSHOP FLOORS.

TO get good results from labor of any kind it is necessary, says "The Ironmonger," that the surroundings should be fit for the class of work carried on, and, as free movement is necessary with all classes of work, the condition of the floors of every workshop is important. To be level, and free from liability to slip are both essential conditions, although the same kind of material cannot be used in all cases. Thus, in an engine-room tiled floors can be used effectively, because they may be kept clean; and as the men employed round the engines do not wear slippery footgear they would not be inconvenienced by them. On the other hand, the same tiles in an oil mill would be troublesome for men to move about on; while in a forge they would soon break up, and the resulting uneven surface would cause trouble.



AUTOMATIC CHAIN WELDER.

Main Floor Materials.

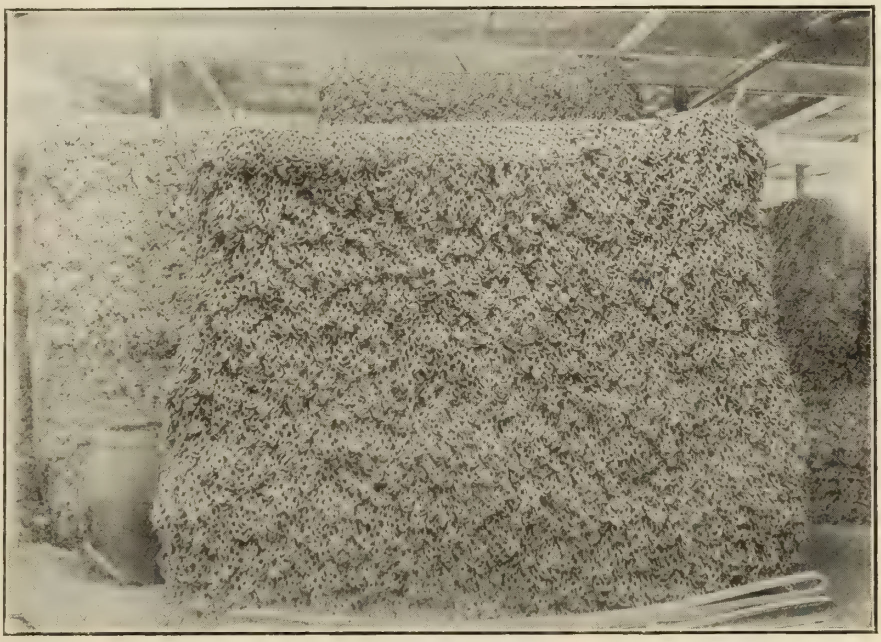
For most floors in manufacturing works, considerable strength should be provided, and usually a good foundation is necessary. Concrete mostly forms as good and cheap a foundation as can be provided, and if made of good materials is hard to beat for strength, particularly if reinforced with expanded steel lathing, as this gives a greatly increased tensile resistance. Strong and continued percussive vibration soon causes concrete to disintegrate, however, and, where this is encountered, clay puddle would stand better; while with proper care it could be faced with bricks or wood blocks with perfect safety. Bricks of a non-slippery character, however, would be preferable, owing to the desirability of keeping the clay puddle moist.

For ordinary engineering workshops, wood blocks on end, if laid on a concrete foundation, give the best results, and if jarrah or other hardwood is used, the floor would last almost indefinitely. At the same time, where cheapness is a matter of primary importance, deal blocks last a reasonable time, but they soon wear lumpy under traffic, and will not resist blows so well as the jarrah. A good deal, of course, depends on laying the surface level, while as far as possible the hardest blocks should be picked out and placed where there is most traffic.

Block floors should be from 4 to 6 in. thick as a rule and the blocks should be well grouted together with hot tar or similar material, with sand plentifully worked in on top. Cement grouting is unsatisfactory, as not only is it inelastic, but it also forms unpleasant ridges when the surface of the blocks wears down. Good sound bricks set on edge make satisfactory floors when there is not much percussion and banging about on them; but they are undesirable if they have a slippery surface, as men may slip and meet with accidents. Boarded floors need no remark beyond noting that they should be stiff enough to carry any weight that the exigencies of the particular trade may impose on them. Concrete floors with or without reinforcement (but preferably with), if made with a shingle facing, are a nuisance in any workshop, but with finely broken sandstone, or even with a crushed-granite facing, concrete makes a good floor, especially for wet work; but it should not be subjected to much hammering.

Smithy floors are usually best when made of puddled clay or marl of a good thickness, as this is tough and does not break up freely. Of course, a certain amount of dampness is necessary, and for this reason only the working floor should be of puddle, the stock and storage part being floored with concrete, bricks, or wood blocks, the latter, of course, not being subjected to heat. With proper precautions as to fixing anvil blocks and foundations, a brick floor may be used with some classes of forge work; but there must be no chance of the floor being slippery with this kind of work.

Foundry floors, where not used as moulding floors, may very well be of clay puddle free from stones and carrying a thin layer of old sand, as the



CHAIN IN STOCK.

splashing of molten metal when spilled on concrete or stone flooring is liable to cause injury. In some parts of the foundry, where the molten metal does not reach, concrete makes a good floor, and so do bricks; but, anywhere else, simply sand or clay puddle sanded over should be used, so that the danger referred to may be minimized. Wood or other combustible material is simply unthinkable in this connection.

Upper Floor Materials.

Where there are upper floors used as workshops the flooring must depend on the character of the work done and the live weight to be carried, for which reason timber or reinforced concrete can be used alone or in combination as the necessities of the case may require. Where there is a lot of hammering and other percussive work, concrete is liable to become disintegrated, and for this reason it is rather an open question whether it is not the better plan to have a thick floor of Lombardy poplar tongued with metal or wood, which would be practically fireproof. Reinforced concrete put together with expanded metal lathing will stand a good many strains short of percussion, but this does not fit it for everything.

Metal floors on metal girders would give good general results but for the reason that provision has to be made for contraction and expansion, such as special treatment of the walls or other bearing points. Where iron or steel floors are used the girders should be on rollers at each point of support; ends passing into walls should be enclosed in boxes, and have space to expand, because, in the case of fire, the walls would be pushed out. Rolled steel plates with chequered surfaces should be in countersunk slots to prevent the plates buckling.

Metal floors are far too slippery to be strongly recommended, however, as workmen having boots with hobnails or steel points in them experience difficulty in maintaining their foothold.

STERN WHEEL TUG MACHINERY.

THE Polsons Iron Works recently shipped to Hudson Bay a stern wheel tug which they built at their works in Toronto. The tug was built for the Dominion Government for service at Port Nelson. A description was given of the tug in the July issue of Marine Engineering, and we now give particulars of the main engines and auxiliary equipment.

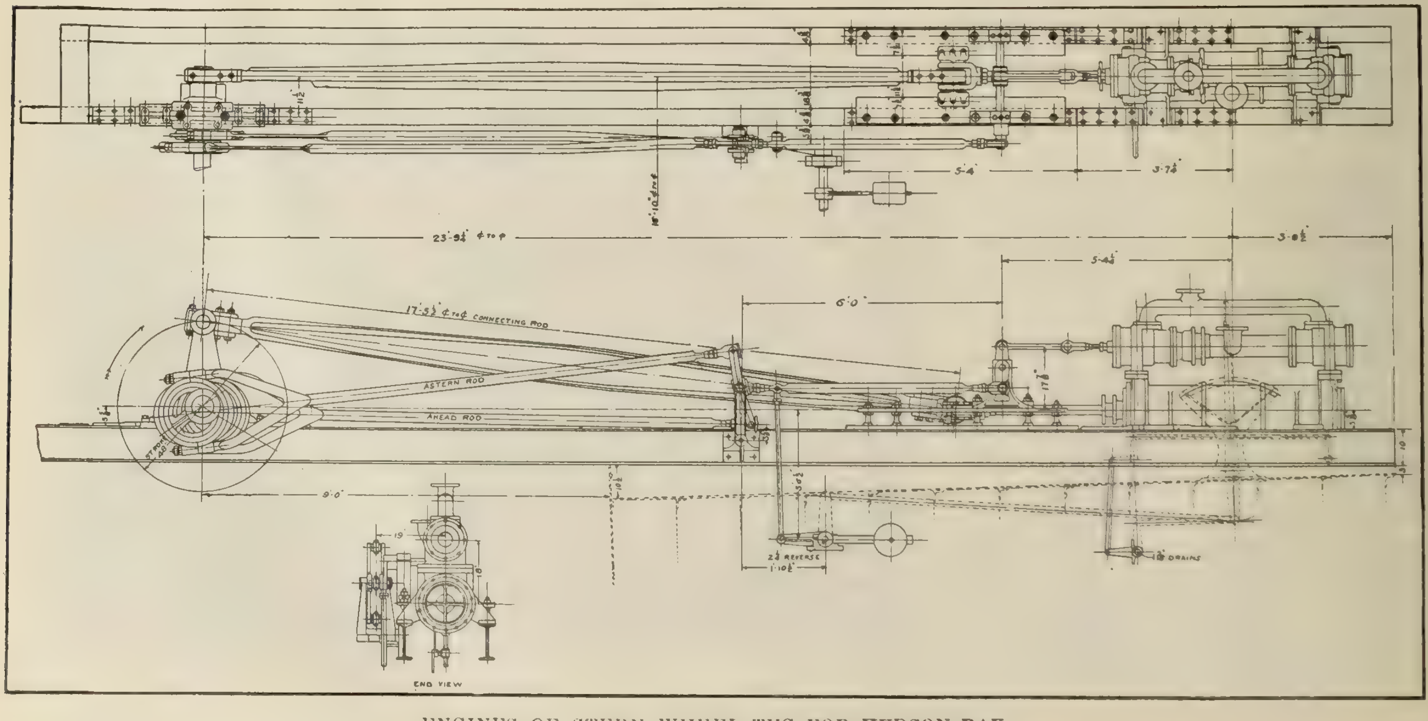
Main Engines.

The main engines consist of one pair, port and starboard, and are identically the same design and dimensions, except that they are right and left-handed. They are of horizontal, single cylinder type, located in the stern of the tug, and are connected to the wheel shaft by long connecting rods. The wheel shaft serves as the crank shaft, and is fitted with a crank at each end, set at 90 degrees. The eccentrics are, of course, fitted on this shaft and inside the cranks. The crank or wheel shaft is 6 7-16 in. diameter and is made of mild steel. The stern wheel is 15 feet diameter overall, and has 13 wooden buckets, each 10 ft. long by 14 in. wide. The wheel is carried by 2-1 beams set at an angle and extending out over the stern and supported by out-board brackets.. The cylinders are secured to the in-board ends of these I beams which serve as a frame for the engines. The engines develop a total of 250 horse power at 28 r.p.m.

The accompanying illustration gives an idea of the general design. The cylinders of both engines are 12 in. diam. by 48in. stroke. The valve gear is of the double eccentric link motion type, and is connected to the eccentrics by rods made of extra heavy wrought iron pipe fitted with suitable connections to the eccentric straps and links. The lever for controlling the valve gear is conveniently located near the cylinders and operates both sets of motion simultaneously. The connecting rods are exceptionally long being 12 ft. centres. They are of special construction in order to reduce the weight as much as possible. Each rod has 2 steel straps with a wood filler between and securely bolted. The connections between the straps and crank and crosshead ends are of special design.

Auxiliaries.

A locomotive type boiler 56 in. diam., by 20 feet long and carrying a steam pressure of 160 lbs. per sq. in., is located forward of the engines. It supplies steam for the main engines and auxiliaries. A No. 12 "National" feed water heater is installed in connection with the boiler. Electric light is furnished by a vertical steam engine driving a 3½ k.w. generator. This set was supplied by the Enberg Electricity & Machine Works, St. Joseph, Mich. Two outside packed duplex pumps 5¼ x 3 x 6 in. are installed for boiler feeding and general service, and were supplied by the Smart Turner Co., Hamilton, Ont. On the deck are installed two double barrel type capstans equipped with 6 x 8 in. double cylinder reversing engines, supplied by tht American Ship Windlass Co., Cleveland, Ohio.



ENGINES OF STERN WHEEL TUG FOR HUDSON BAY.

"Leonard" Locomotive and Car Shops of the N.T.R. at Quebec

No more effective expression of confidence in the future development of the Dominion of Canada and its progress towards a place in the forefront of the world's commerce need be sought beyond the fact that, at chosen points from coast to coast, are being located by our great railroad corporations, locomotive and car repair shops whose layout and equipment makes provision for the inevitable demand which, in a few years more, will assert itself. This preliminary sketch covering the National Transcontinental shops at Quebec, has a live interest for subscriber and advertiser alike.

THE general layout of the repair shops of the National Transcontinental Railway at Quebec, P.Q., shows that not only has convenience of operation been the general principle governing the design, but future needs have also been provided for. Each shop is capable of extension without interfering with any other, and each department can be increased independently as occasion may require.

There are eleven buildings in all, of various dimensions, each suitable for the special work to be done in them. These buildings consist of a locomotive erecting, machine and boiler shop, under one roof; forge shop, freight car shop, stores building, power house, planing mill, dry kiln, lumber shed, forge stores and scrap bins, oil house, and office building for the the executive staff. The total area covered is about five and one-half acres.

The Erecting Shop.

In the erecting shop there are eighteen pits, placed tranversely, over which a 120-ton crane lifts locomotives into and removes them from their respective positions. A 20-ton crane, operates over the same area at a few feet lower level, and carries small material and makes light and rapid lifts.

The "transverse-pit layout" has the advantage of doing away with many side doors in the building for the "in-and-out" movement of locomotives. There are two doors, conveniently placed, through which engines and material enter and leave. This arrangement is economical in the matter of heating. It does away with the necessity of a transfer-table with all its inconvenience from snow and ice. The practically unbroken sidewall permits the use of jib cranes, one serving the fronts of two locomotives, and capable of lifting smoke stacks, main valves, smoke box doors, rings, etc. The use of these very handy cranes would be most difficult if the wall of the shop had been cut up into a series of doors.

The Crane Feature.

The cross-section of the shop shows the position of the cranes. The large crane is carried on a series of built-up columns, so that, the heavy load is central over the line of foundations. As one crane does the work of lifting and placing each locomotive, there is no chance of confusion such as might occur when two cranes are used, and where two men do the work. The single powerful crane has also the advantage over the usual twin crane arangement in economy of first cost and maintenance.

All the overhead cranes are provided with effective safety appliances. One of the most important, prevents the load from being "over-wound" by the lifting drum, either by accident or otherwise. It consists of a device which, when the maximum lift has been reached, automatically opens a switch on the hoisting circuit and so cuts off the current, thus suddenly removing the driving power. The cessation of the current immediately brings into powerful action a gravity operated brake which is normally held out of service by the flow of current.

Midway Crane Arrangement.

The direction in which the midway crane operates is a new departure in railway shop construction, which has been brought out by Mr. W. J. Press, mechanical engineer of the commission. It secures substantial advantages. The midway is laid out so as to be alongside of the shops, and not at the ends of the buildings as is frequently the case. The object of this arrangement is that when material is brought by the midway crane from the storehouse, forge shop, or foundry to the machine, erecting or boiler shop, it is placed at the door nearest to the machine on which the material will be handled, or to the engine upon which it will be used. In this way, the delivery of material is not concentrated at one spot at the extreme end of the building. It avoids distribution from a congested area, and it obviates the "long haul" through the shop. Material is laid down at a point as near as possible to its destination, and economy

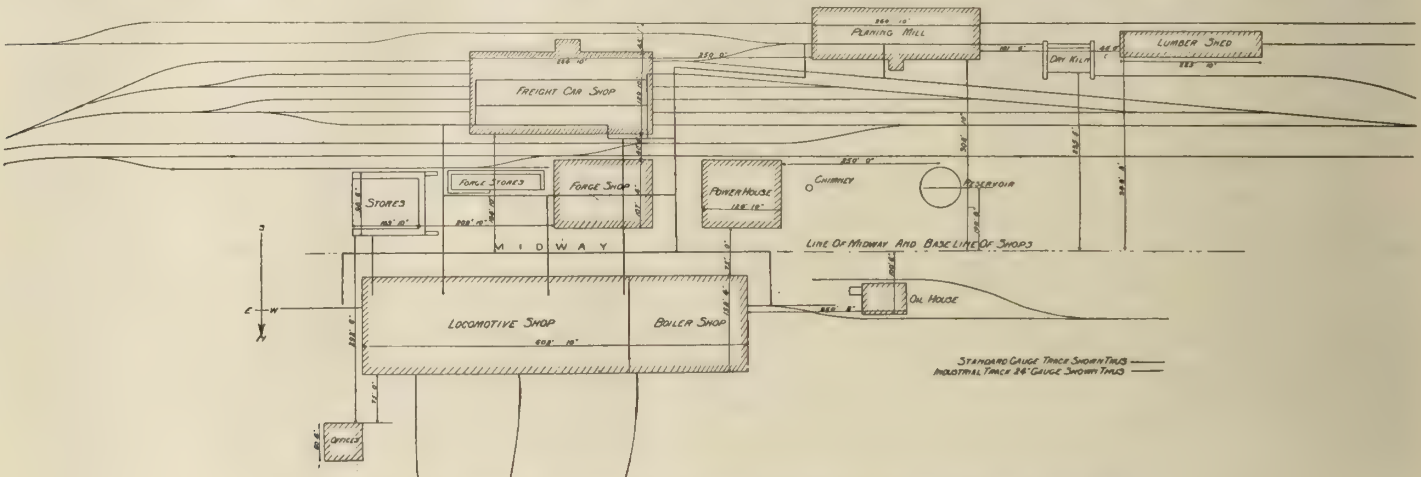
of time and labor, as well as facility in handling is thus secured.

The system of placing machines is such that the movement of material will be in one direction and the distance over which any locomotive "part" is carried, will not be unnecessarily lengthened by journeys forward from one machine and back to another. The continuous one-way movement of material saves time and labor and prevents interference.

The pits in the locomotive shops are supplied with steam, compressed air, hot and cold water. Depressions in the pit walls carry the pipes. By this arrangement, the working space in the pits is not restricted, and the pipes are not where they can be easily damaged by workmen dropping material on them; and, thus, while being quite safe, they are out of the way.

Forge and Boiler Shop.

The forge shop and the boiler shop are placed as near as possible to the power house. This is important, for in the case of the forge shop, where hammers are operated by live steam, the short distance between boiler and hammer reduces condensation and delivers steam where it is required with small loss. A similar condition holds good in a sense, for the delivery of compressed air to the boiler shop machinery. The nearer the source of supply, the less the pipe friction involved and the smaller the losses due to the forcing of air through the pipes.



LAYOUT OF THE "LEONARD" LOCOMOTIVE AND CAR SHOPS AT QUEBEC.

General.

Industrial tracks form convenient means of communication between the various shops and the buildings, cars, engines and supplies are protected by a water-system arranged to be readily put into use in case of fire. A further protection is afforded by reason of the use of concrete and steel in the various structures.

The shops are situated at Quebec, and have been named after Major R. W. Leonard, chairman of the National Transcontinental Railway Commission, under whose administration they were projected. The outlay has been carefully supervised so that excellent results will be attained and full value received for the money expended.

The whole plant has been laid out under the supervision of Mr. Gordon Grant, chief engineer, in such a way that the latest and most modern railway practice has been provided for, the design being second to none in the country.

The permanent and substantial character of the shops and the size of the whole plant will be of material advantage to the city of Quebec, by providing steady employment for a considerable number of men the year round. The contract for the buildings has been awarded to Mr. Joseph Gosselin, of Pt. Levis, Quebec.

The design and laying out of the plant, the relative size, arrangement and position of the buildings and the selection of the machinery and appliances have been entrusted to Mr. W. J. Press, mechanical engineer of the commission who had charge of similar work at the Transcona shops of the National Transcontinental Railway near Winnipeg. The latter are now being operated.

In general plan and in kind and quality of equipment they are of the most up-to-date type. The Transcona and the "Leonard" shops, when completed, will embody such design and practice, as will enable them to be operated with a very high degree of efficiency. Altogether they will form a most valuable addition to the second of the great National "cross-continent" highways of Canada.

NEW C.P.R. ST. LAWRENCE BRIDGE.

ONE of the greatest undertakings which the Canadian Pacific Railway Co. have had in hand during the past three years has been the reconstruction of the St. Lawrence bridge over the river St. Lawrence between Highlands Station and Caughnawaga. This remarkable engineering job was completed on Tuesday, October 28, when Mr. David McNicoll, vice-president of the C.P.R., tightened up the last bolt in the track and officially opened this double track bridge to general traffic. The interesting ceremony was performed in the teeth of a strong wind blowing at the rate of between thirty and forty miles an hour.

Those present included, in addition to Mr. McNicoll, Mr. Phelps Johnson, general manager of the Dominion Bridge Co.; G. H. Duggan, chief engineer of the Dominion Bridge Co.; A. D. MacTier, general manager, the C.P.R. Eastern lines; P. B. Motley, engineer of bridges, the C.P.R.; H. H. Vaughan, assistant to the vice-president of the C.P.R.; J. M. R. Fairbairn, chief engineer of the C. P.R.; J. K. McNeillie, superintendent of Montreal terminals; F. W. Cowie, chief engineer, the Montreal Harbor Commissioners; M. S. B. Brown, engineer of the C.N.R. tunnel; C. N. Monsarrat, chairman of the Quebec Bridge Commission; and Mr. George Hodge, superintendent of the Eastern lines of the C.P.R.

The party left Windsor street station by a special train and on arrival at Highlands picked up the representatives of the Dominion Bridge Co., afterwards proceeding to the bridge which was inspected, and the last bolt put into a rail joint by Mr. McNicoll. A silver nut and bolt had been prepared by the engineers for the purpose and after the camera man had taken a picture of the interesting group, Mr. McNicholl gave the nut a last turn and the bridge was completed. The train then conveyed the party to the Caughnawaga end of the structure which was also inspected. The party subsequently returned to Windsor station, after which an adjournment was made to the Mount Royal Club where luncheon was served over which Mr. Phelps Johnson presided.

Before the party separated Mr. Johnson said that they had completed that day what had been undreamt of twenty-five years ago, and the work was a credit to all who had been connected with it.

Bridge Statistics.

Mr. P. B. Motley, the engineer of bridges for the C.P.R., gave a few interesting statistics with respect to the erection of the bridge. He said that it had taken three years to build. There were really two bridges, each of single track, and, by well considered methods, the structure was erected in sections, traffic being shifted from up-stream to down-stream until the whole was finished right across the river.

TIGHTENING THE LAST NUT ON THE NEW C.P.R. BRIDGE OVER THE ST. LAWRENCE.

In June, 1910, the steel and masonry was going up together, and the first half of the bridge was completed between June 1910 and March 1912. Last spring after desultory work during the winter, the old spans that remained were taken down, and the last of the channel spans installed.

As far as speed is concerned, between April 21 and October 21 this year, the last five old spans—two 270 feet, two 408 feet and one 120 feet—were taken out and five new spans of similar length erected. This work was accomplished in six months which is understood to be a record for the moving of 4,000 tons of steel with traffic passing all the time. In connection with the work of building the bridge, there were 3,500,000 rivets used. It was interesting to know also that only two men had lost their lives during the great undertaking. One fell off a scow into the river and could not swim, and another man fell off a locomotive derrick in the yard. Mr. Motley complimented the Caughnawaga men on the part they had taken in the work. The bridge is five-eighths of a mile in length as against that of the Victoria bridge of two miles and a half.

The floating in of the third and fourth channel spans had been acomplished in record time. The third took 22½ minutes actual time, while the fourth had been placed into position in 15 minutes, which was certainly a remarkable achievement. He congratulated the Dominion Bridge Co. on their excellent work. It required 3,450 cars to handle the material.

The bridge is now in full operation and greatly assists the operation of traffic in and out of the Montreal terminals.

RAPID METHOD OF COLORING DRAWINGS.

EVERY draftsman has occasion at one time or another to color a drawing or a whiteprint. The use of colored inks is unsatisfactory; cross-hatching in colors obscures the details and is slow, while water colors have the disadvantage of slowness besides being difficult to apply evenly.

A quick and satisfactory method of coloring involves the use of ordinary wax crayons and gasoline, says the Engineering and Mining Journal. Crayon of the color desired is applied and then rubbed with a piece of cloth, wet with gasoline, until the color is even, and extended to the limits desired. If it overruns the lines, it can be erased with a pencil eraser.

Some colors, particularly the yellows, purples, greens and light blues, produce much better results than others. It is probable that the gasoline dissolves the wax from the crayon, leaving the pigment as an impalpable powder, which, when rubbed over the paper, colors it uniformly. The method is applicable with equal success to egg-shell and smooth drawing papers and to white prints on both paper and cloth.

Personal

C. S. Wilcox, president of the Steel Company of Canada, has been staying at Hot Springs, Va.

H. H. Powell, manager of the Brantford Gas Co., has resigned. He is succeeded in Brantford by H. Stringer.

William Crawford has been elected secretary of the Alberta Rolling Mills Co., Medicine Hat, Alta., in place of A. L. Scott.

A. C. D. Blanchard, formerly city engineer of Lethbridge, Alta, has been appointed to the engineering staff of the Greater Winnipeg Water District.

N. A. Yarrow, of Yarrow's, shipbuilders, Glasgow, was in Vancouver last week on a pleasure visit. He denied the report that his company would build there.

A. E. Hanna, manager of the Winnipeg branch of the Steel Co. of Canada, was in Montreal during the past week. Mr. Hanna has been spending a vacation

J. K. L. Ross has been elected a director of the Canadian General Electric Co. to fill the vacancy created by the death of his father, the late James Ross.

A. Leo Mieville, until recently the Canadian representative of W. H. Allen, Son & Co., Ltd., Bedford, Eng., has joined the staff of Smith, Kerry and Chace, consulting engineers, Toronto, and has gone west on business.

Obituary

John Milne, Burk's Falls, Ont., who has built many saw mills and sash and door factories in Ontario, died Oct. 22. Building

Louis Bartholomew, who established the first foundry in Orillia, Ont., died on Thursday, October 30, at Montreal. He started his foundry in 1870, later selling it to Vantassel & Newton, who sold it to Tutton's.

AMBULANCE BRIGADE IN A CANANDIAN MANUFACTURING PLANT.

By S. Holland.

IT is a well known law of physics that great bodies move slowly, and such is the case with the St. John Ambulance Association work in Canada. This great philanthropic movement is well known in the British Isles.

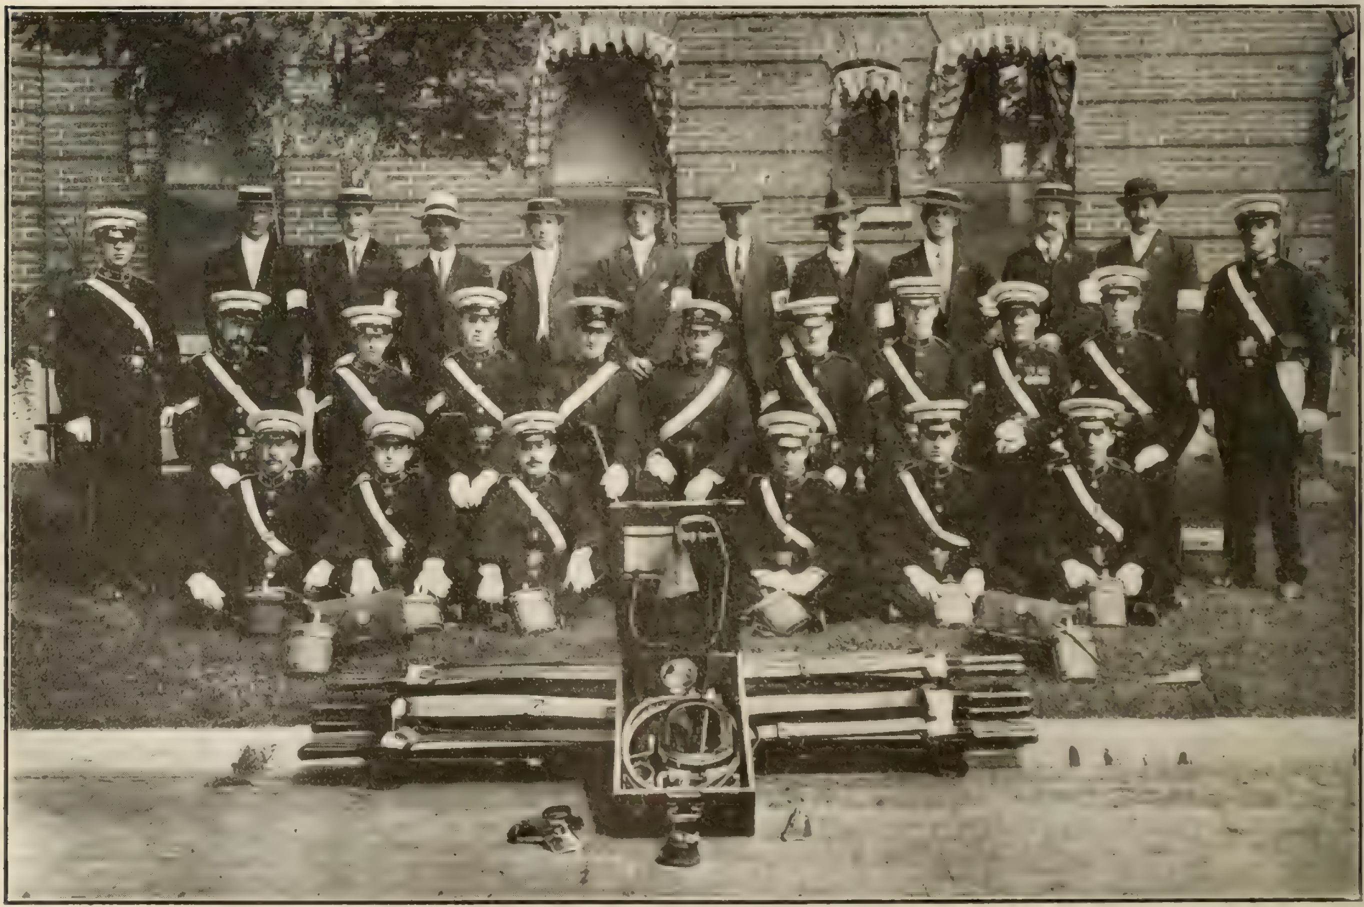
Being a British institution, it naturally expanded slowly in other parts of the British Empire, but judging from the progress being made in Canada, its permanency here is assured. The manufacturer, railroads, police departments, stores are recognizing the value of "first aid to the injured," and are encouraging their employes to qualify themselves in same.

According to statistics from the Labor Department of Canada covering the years 1904 to 1910, there are, annually, 2,000 workmen killed, and 10,000, whose industrial efficiency is impaired for all time, while in the course of their employment. This does not cover the thousands of accidents which happen in the home, on the street, and those of the pleasure party. Figures of this kind are of an appalling nature, and mean a great loss annually to this young and rapidly growing nation, and are sufficient argument, why the St. John Ambulance Association work should be encouraged in every way.

Classes in "first aid" have been carried on in many places, and men have qualified themselves for this work. In many instances, lectures have been given gratuitously by the medical profession, and the members of the classes have not had to buy their own equipment. The latter is one reason why the work has been hampered, and in addition, some firms have looked on indifferently at the efforts of their employees to obtain a knowledge of "first aid," little thinking of the value of these employes over those who have not the knowledge. The lack of encouragement by employers is a great hindrance to the work, and decidedly detrimental to themselves.

Another branch of "first aid" is the St. John Ambulance Brigade, which is the organization of these men who are qualified in "first aid," into companies, to render practical assistance to the public on the street, or their fellow employes in the shop. Col. Sir H. M. Pellatt, is the deputy commissioner of the Brigade for Canada, and Capt. G. R. N. Collins has been, and is at the present time traveling from place to place, giving illustrated lectures on the aims and objects of the association. One of the first divisions of the Brigade to be organized was in connection with the works of the Canadian Westinghouse Co. of Hamilton. This division consists of 45 men who have given a great deal of time and study to the work, many of its members not only holding "first aid" certificates, but also having qualified in home nursing, hygiene and military sanitation. These men not only qualify but must stand a yearly re-examination to prove beyond all doubt that they are capable of rendering such assistance as may be necessary to any sick or injured person.

The members of the division are distributed throughout the large plant of the Canadian Westinghouse Company, so that, whenever an accident occurs, a skilled man is within hailing distance, and the injured person is removed to a large room in the works, which is equipped with stretchers, lockers filled with dressings, a pulmotor and all the different articles necessary for the work, and where an efficient "first aid" man is in charge. If deemed necessary, the injured employe is handed over to the works surgeon for further treatment. It is a standing rule that any employe receiving a minor injury such as a small cut or abrasion must report at once to the "first aid" department and have his injuries cared for. While this is not a military body, its members are uniformed, and have to undergo certain military



AMBULANCE BRIGADE AT THE CANADIAN WESTINGHOUSE CO. PLANT, HAMILTON, ONT.

training for the purpose of promoting discipline and uniformity of movement, this being necessary in removing patients by stretcher and when mobilized for public duty.

Besides being of service to the company, the division do public duty at skating rinks, football matches and other large gatherings, and during the recent Centennial Celebration, they were of great assistance to the public.

This division, since its organization, October, 1912, has to its credit some 390 cases, which have been cared for on public occasions. For the furtherance of the work, a class of instruction is held each year, when a full course of lectures is given for persons desirous of taking the course. This class started three years ago, during which time 300 persons have received certificates. The work is done free of charge by the members of the brigade.

It has been demonstrated, from the experience of a large number of Canadian firms, that the protection afforded the employer by having classes of employes trained in "first aid," fully compensates him for the small expense attached to such an institution, and since it is a well-known fact, that a dressing properly applied immediately after the accident, materially reduces the period during which the injured person is unable to perform his duties, it is to the interest of every employer of labor to not only train his employes, but in addition, to have a "first aid" outfit on the plant to meet all emergencies.

REPORT ON BOILER EXPLOSION AT COLLINGWOOD, ONT.

T. J. MAIN, Provincial Boiler Inspector, in his report to D. M. Medcalf, Chief Boiler Inspector, Province of Ontario, says:

On September 25th, by your instructions, I proceeded to Collingwood, Ont., to inspect a boiler built by the Sawyer Massey Co., and owned by Blackstock Bros., and situated at their farm about two and a half miles from Collingwood. Blackstock Bros. were endeavoring to sell the boiler and engine to Schell Bros., and were running a test with the steam gauge standing at 80 lbs. per square inch and with 3 inches of water showing in the glass when the boiler exploded, killing Edward Blackstock, while his brother, Neil, received very serious injuries. The Schell Bros. were not seriously hurt.

Boiler Features.

The outfit is known as a threshing engine and boiler mounted on wheels. The boiler is 28 in. diameter, and contains 36 tubes 2 in. diameter by 70 in. long. The shell is 3-16 in. plate; the heads, wagon top and furnace ¼ in. plate; the front head and furnace tube sheet 5-16 in. and the foundation ring of cast iron 2 in. by 2 in., and flange 1 in. by ½ in. The furnace was 23½ in. by 32 in. inside. The boiler was made of steel throughout; the riveting of longt. seams ⅝ in. rivets by 2¼ in. pitch; circum. seams ⅝ in. rivets by 1⅞ in. pitch. The screw stays were ¾ in. diameter by 12 threads per inch.

All parts of the furnace and crown sheets were in fair condition. The shell of boiler was made in two courses, and the rupture started on the front end of the centre course just below the longt. seam. The longt. seams are about ten inches below the centre line of boiler, and the lap joints look down. They are made that way so that when the machine is out in the weather the rain or water will run off without laying on and corroding the seams.

It would appear that the caulking on this seam had been defective, and leaked slightly for some time, as the shell plate at this point had corroded until it was only .047 or 3-64 in. thick at the front end of this seam. At the other end of this seam, the thickness is .104, plainly showing that the seam had been leaking the whole length. When the longt. seam let go, the force of the explosion was downward, the second course shearing off at the line of the first course, just back of the riveted seam. The boiler and engine then scattered over a radius of 100 feet.

The safety valve was free and appeared in good working order. There was no slope to the water gauge. The injector (Penberthy) is practically new. They were carrying 80 lbs. pressure per square inch when the explosion occurred. When they had stopped using the boiler about one year ago, they had been carrying 120 lbs. pressure. At its best, when new, according to our regulations, it was never good for more than 100 lbs. pressure:

$$\frac{2\times.1875\times60000\times.69}{28\times5.5}=100\text{ lbs. W.P.}$$

and when the boiler explosion took place it was not good for more than 25 lbs. W.P.

$$B\ \frac{2\times.047\times60000\times.69}{28\times5.5}=25\text{ lbs. W.P.}$$

The place where the rupture took place was easy of access, and if the boiler had been under inspection, the corrosion could easily have been detected, an explosion prevented, and lives saved; in fact, boilers of this class, with such light plate, could not be allowed under present Regulations.

When it is realized that boilers of this class do not come under the present Regulations, and that manufacturers of this class of boiler are still building them of the same material, and further, that there are hundreds of these boilers in Ontario in no better condition than the one that exploded, and that it is not by any good management of the owners that they hold together, then something ought to be done to save the people from themselves.

POWER DEVELOPMENTS NEAR MONTREAL.

HYDRO-ELECTRIC development in the Montreal district has made rapid strides of late, and is on a scale that anticipates a large demand for power in the near future. The Laurentide Company's new plant, which is expected to be completed next spring, will increase the development at Grand Mere to 80,000 horse-power, which capacity can be further brought up to 100,000 horse-power at comparatively low cost. A considerable portion of this power will be available for purposes outside of those of the company. The present development at Grand Mere is 22,000 horse power.

The Cedar Rapids plant, with an initial capacity of 100,000 h.p., and 160,000 aimed at ultimately, will, according to the latest reports, be ready by the autumn of 1914, according to the original plans.

With both the Cedars and the new Laurentide plants in operation, and the extensions carried out at Shawinigan this summer completed, the hydro-electric development in the district of which Montreal is the centre should be upwards of 400,000 horse-power by the end of 1914. This is exclusive of the plans of the National Hydro-Electric Co. at Carillon, of which comparatively little has been heard recently, but which aim at a development of 160,000 h.p. The Montreal Light, Heat and Power Company's water powers at Chambly, Soulanges and Lachine, the Canadian Light & Power's plant at St. Timothee and smaller plants account for 100,000 horse-power in addition to the foregoing.

The following table gives the total development in horse power of hydro-electric plants in and around Montreal, which should be available by the end of 1914, together with the announced extensions in view:

	Dec., 1914.	Planned
Shawinigan	140,000	....
Do. hydraulic ...	45,000	....
Cedars	100,000	160,000
Soulanges	15,000	....
Chambly	20,000	....
Lachine	12,000	....
Laurentide	80,000	100,000
Can. L. & P.	30,000	....
National H.-E.	....	160,000

MACHINE SHOP METHODS AND DEVICES

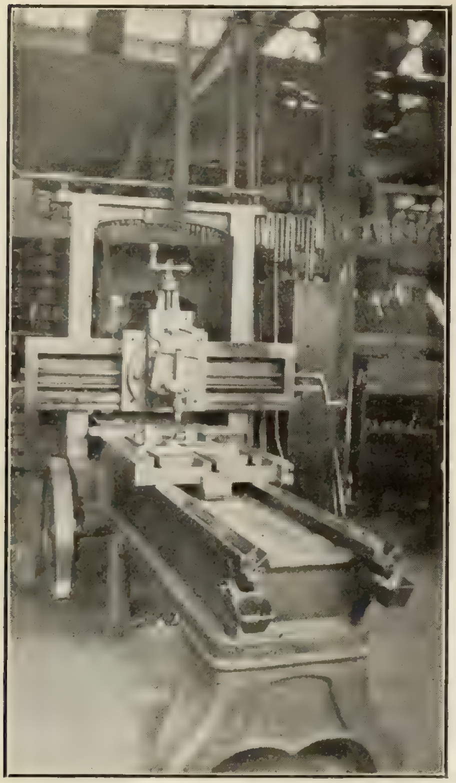
SAFEGUARDING PLANERS.

By D. A. Hampson.

WHEN a guard is placed over the two gears generally found on the "off" side of a planer and a rail of some kind put around the driving pulleys, it is considered reasonably safe. However, there are two other places where guards may be employed to advantage—places where the possibilities of accidents are slight, but if accidents do take place, and a number of such are recorded, the injuries are of the most serious nature. One of these places is the open bed with its cross braces, across which the table reciprocates all day long. Should anything or anybody get caught there, the least that would result would be a broken limb. The writer has covered the gaps in a number of planer beds in the manner shown by the photograph, which is of a 20 in. x 7 ft. machine.



SAFEGUARDING PLANERS.

The covering is a length of 1-32 in. sheet steel. It has an opening cut out for the bull gear to pass through, and is held in place by its own fit and six countersunk screws. Thus safeguarded, the planer is absolutely free from any accident which might occur; the appearance is neatness itself; it is easily and quickly cleaned, and chips are prevented from falling down into the gear, reversing mechanism and bearings. Summed up, it safeguards the man, it protects the machine.

The other source of danger is the lower side of the contact area of the pinion and gear on the opposite side from the operator. As mentioned before, a guard is invariably found over these gears; but many of the guards do not fully protect from something catching in the gears when the motion is reversed. Nearly all the recorded accidents from this source have been in situations where two or more machines were arranged side by side; the operator of one machine has his back to the other, and in stooping over, one leg has been thrust out behind to balance, and the ankle or the overalls have caught in the gearing. The machines mentioned above, though it does not show in the photo, have the original guards supplemented by sections of 1-16 in. steel, entirely covering the pinion and its lower contact area.

Considering the financial standpoint, it cost an average of a little less than two dollars per planer to equip—a mere trifle compared to the "cost" of the one accident which might occur and which is thus averted.

◆

AN IMPROVED DOUBLE BORING AND FACING JIG.

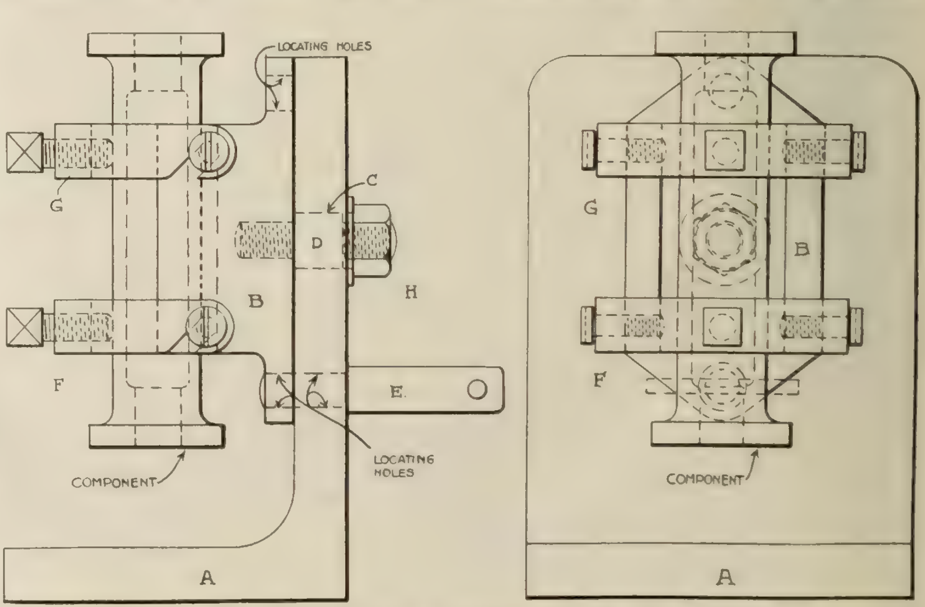
By W. G.

THE jig herewith described is of simple construction, and will be found useful for drilling and facing cylindrical work at opposite ends, particularly if the question of accurate and rapid production be considered.

The jig in question was used for boring and facing a number of small distance columns similar in shape to that shown in the accompanying drawing. The centre hole of the said component was rough cored, but it was necessary that the extreme ends should be bored out, and the faces accurately machined, in order to procure true alignment when the components were assembled. The complete machining of both ends was performed without removing the component from the jig, thus procuring absolute alignment of the two ends. A glance at the drawing will give a clear idea of the construction of the jig.

Fig. 1 is a side view showing general arrangement with component in position for work, while Fig 2 is an end view. The body (A) consists of a cast iron angle plate on to which is swivelly mounted the cast-iron V block (B), the latter having lugs at its extreme ends The hole (C) is for the purpose of securing the fulcrum pin (D). Part (E) is the locating plug, while (F) and (G) are the clamping straps, two of which are preferably used, being secured to the necks of the cheese-headed pins as shown. The sequence of operations is as follows:—

The component is secured to the jig by means of the clamping straps (F) (G) and the locating plug (E) passed into position, thus preventing the V block (B) from rotating. The nut (H) is next tightened, thus securing the V block to the angle plate (A) in position



FIGS. 1 AND 2. IMPROVED DOUBLE BORING AND FACING JIG.

for work. The boring and facing operation at one end is then performed. The nut (H) is afterwards slackened off, the locating plug removed, and the V block turned round, bringing the other end of the component into operation. The locating plug is replaced, thus bringing the axis of the component into true alignment with that of the boring and facing bar.

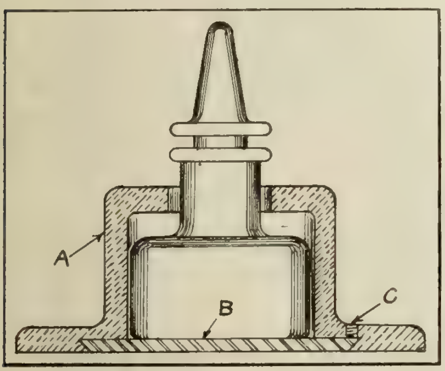
INK BOTTLE HOLDER.

By E. W. Tate.

THE illustration shows a device used in connection with a draftsman's ink bottle, to prevent the latter being upset. The cylindrical shaped holder (A) was, in the experience of the writer, made of bronze, a material in every respect highly suitable and satisfactory. A steel plate retaining slide (B) is held in place, after the bottle is inserted, by means of the friction screw (C).



INK BOTTLE HOLDER.

CALCULATING BAR STOCK REQUIREMENTS.

S. N. Bacon.

A TIME-SAVING table and formulae by which it is figured are given herewith. The purpose served by the table is to make it possible to tell at a glance the amount of bar stock necessary for making one thousand pieces of a certain length on the screw machine or lathe.

The first column of figures show the various lengths, and the second column, the number of feet of stock necessary; this figure being found by multiplying the length of the piece by a constant, and through the use of which, the table may be extended to include other lengths, if desired. The constant, 84.08, is derived as follows:—

Screw machine stock comes in 10-foot bars and an allowance of one inch is made for chucking on each bar. This leaves 119 inches of stock in each bar, and taking the unit length of one piece as one inch, 119 pieces can be made from each ten foot bar.

$119 \times 8 = 952$ can be made from eight 10 foot bars.

$1{,}000 - 952 = 48$ pieces to be made from another bar.

$48 \times 1 +$ (1 in. allowance for chucking) $= 49$ in. $= 4.08$ feet.

Eight 10 foot bars $= 80$ feet.

$80 + 4.08 = 84.08$ ft. for 1000 pieces 1 inch long.

Other lengths are in proportion, so that this figure 84.08 is a constant multiplier.

.205	17.2	.395	33.2	.585	49.2	.775	65.1
.210	17.6	.400	33.6	.590	49.6	.780	65.5
.215	18.1	.405	34.0	.595	50.0	.785	66.0
.220	18.5	.410	34.5	.600	50.4	.790	66.4
.225	19.0	.415	34.9	.605	50.8	.795	66.8
.230	19.3	.420	35.3	.610	51.3	.800	67.2
.235	19.7	.425	35.7	.615	51.7	.805	67.6

As an example, suppose a piece to be required, .140 in. in length, and that an ⅛ in. cut off tool is used. The total stock for one piece will be $.140 + 125$, or 265, then

$265 \times 84.08 = 22.3$ ft. per 1000 parts, as per table.

Weight of Bar Stock.

To find the weight of any quantity of bar stock, the following somewhat simplified formula may be used:

Steel Wire $= \text{Dia.}^2 \times 2.6748 \times F = W.$

Brass Wire $= \text{Dia.}^2 \times 2.8584 \times F = W.$

Iron Wire $= \text{Dia.}^2 \times 2.6508 \times F = W.$

$F =$ No. of feet of stock, and $(W) =$ weight in pounds.

The above constants are derived as follows:—

Weight of one foot of wire of any diameter $= .7854D^2 \times (.2836$ weight of one cu. inch of steel$) \times 12$, and this may be

Length of piece and cut-off tool.	Feet per 1000	Length of piece and cut-off tool.	Feet per 1000	Length of piece and cut-off tool.	Feet per 1000	Length of piece and cut-off tool.	Feet per 1000

.990	83.2	1.360	114.3	1.740	146.2	2.600	218.5
.995	83.6	1.370	115.1	1.750	147.1	2.650	222.7

reduced to $D^2 \times 2.6748$, as $.7854 \times .2836 \times 12 = 2.6748$.

Applying the above to finding the weight of 73.1 ft. of steel wire, .100 in. diameter:

$$100^2 \times 2.6748 \times 73.1 = 1.96 \text{ lbs.}$$

SPLASH LUBRICATION.

By H. Westwood.

ONE noticeable feature in the operation of gas engines is that the vertical engine running with the splash system consumes more oil than the hand oiled horizontal engine of the same horse power. One spot of oil at the right place is worth a quart at the wrong. In the case of the hand-oiled horizontal engine, if the cups are feeding too fast they can easily be adjusted, but, in the case of the vertical type-splash system you must keep the oil to a certain level in the crank case and let the connecting rod bolts throw all the oil that will hold to them. It is a common thing to find a 100-h.p. engine on the splash system consuming 7 to 8 gals. of oil in 24 hours, while 1 gal. will easily lubricate the hand oiled engine. I had a case some time ago of a vertical engine which consumed 5 gals. in eleven hours.

A representative of a well-known oil firm came along and said the oil I was using was no good, and if I would use his oil it would only take 1 gal. per day. This new oil was worth three times as much in price as the oil I was using; however, I decided to try two barrels. The crank case was cleaned out and 35 gals. of the new oil put in, but in order to keep the case level the same, I had to use as much of the high-priced oil as I did of the low.

I decided later to lower the oil in the crank case, and thus stop the engine throwing so much up into the cylinders. I altered the oil level so that the connecting rod bolts did not touch the oil at all. Four 1½ in. bolts and 4 nuts and cotter pins can pick up a lot of oil.

I took out the two back bolts, and drilled and tapped a hole for a ½ in. stud. I bent the stud ½ in. over at the bottom and flattened it out for an oil slinger. I then screwed the stud into the connecting rod bolt and locked it with a lock nut. The stud dipped into the oil 1½ inches. When the engine was started up, I took good care to see that the cylinders were not running hot, and, after five hours' run shut down and found the cylinder walls well oiled. This move cut the oil down to 1 gal. per day, but one half gal. in ten hours on a bearing 8 in. x 7 in. was not enough, so something had to be done to use the oil from the crank case.

I got a small pump which had been used to circulate the jacket water on an automobile. It was 1 in. bore by 1¾ in. stroke. I attached this to the side of the crank case and drove it by a ⅝ in. Con. rod attached to the end of the exhaust cam shaft. I made the pump discharge into a two gallon tank located on the back of the engine between the two cylinders and piped the oil to run through two 1 quart sight feed oil cups, one on each side main bearing, also a pipe to the centre bearing in the crank case. The oil then ran in a steady stream all the time the engine was running.

This method supplied the bearings with about 10 gals. of oil an hour, where as before they only received 1 gal. in ten hours. The wear of the bearings was not only reduced, but the engine ran smoother, and cut down the oil expense by $300 a year.

DRILL JIG AND FIXTURE DESIGN.

By H. R.

FIGURE 150 in the accompanying illustration shows clamping arrangement somewhat similar to Fig. 147 on page 455 of our November 6 issue. Its purpose, however, is to support work in quite a different manner.

Referring to the sketch, (a) is the main jaw bored to suit the other jaw (b), while both jaws are operated by the knurled screw (c), a compression spring pressing the jaw (b) against the screw. The work is held as in a vise, the jaws being secured by the wedge arrangement (d), as in Fig. 147 already referred to. The screw of the mechanism (d) operates in a slot in the body of (b), and holds it from turning against screw (c).

Fig. 151 shows a spring pin that is used for supporting work, any number of which may be used in a jig. When a rough casting is pressed upon the pin, the spring automatically adjusts the latter up to the work, and afterwards it is locked in position by the set screw.

Fig. 153 illustrates a good type of hook bolt. In this design the hook is in the form of a sliding collar, and is adjusted by a screw, but it will be well to note that all hook bolts are better backed up by a portion of the fixture as shown.

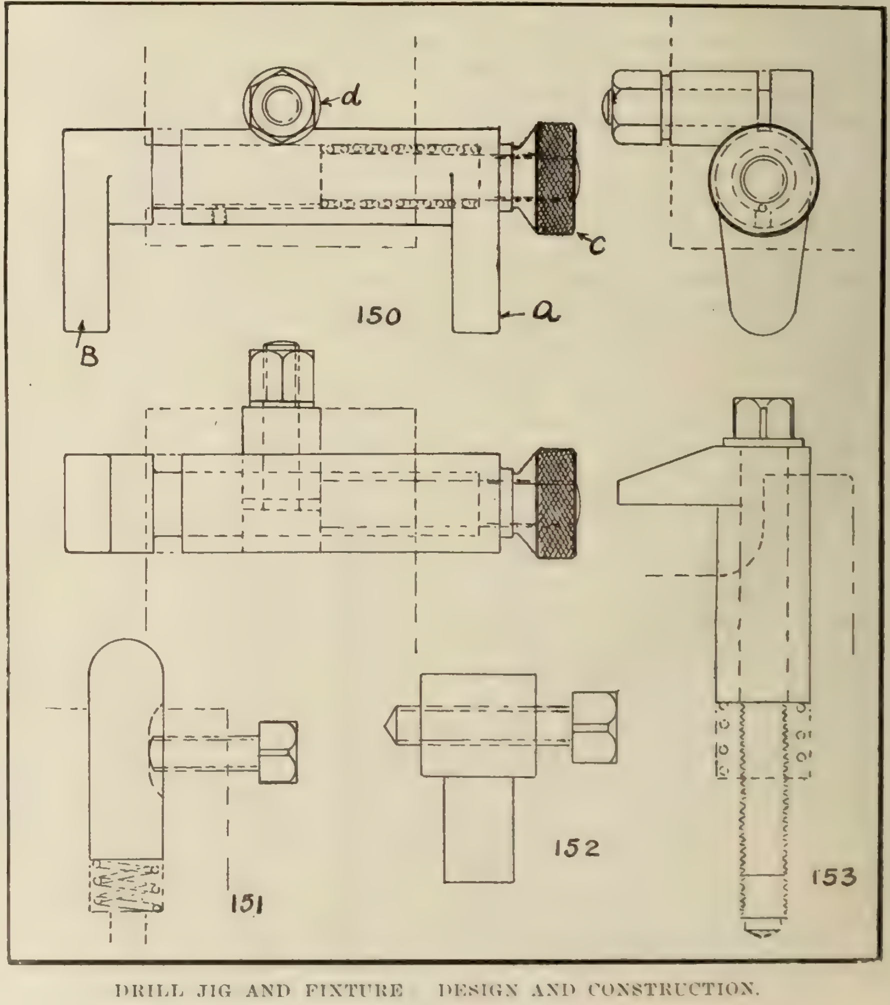
Superintendent Sullivan, of the Welland Canal, has been appointed assistant to Chief Engineer Weller. His post as head of the present canal will be filled by L. N. Hara, of St. Catharines.



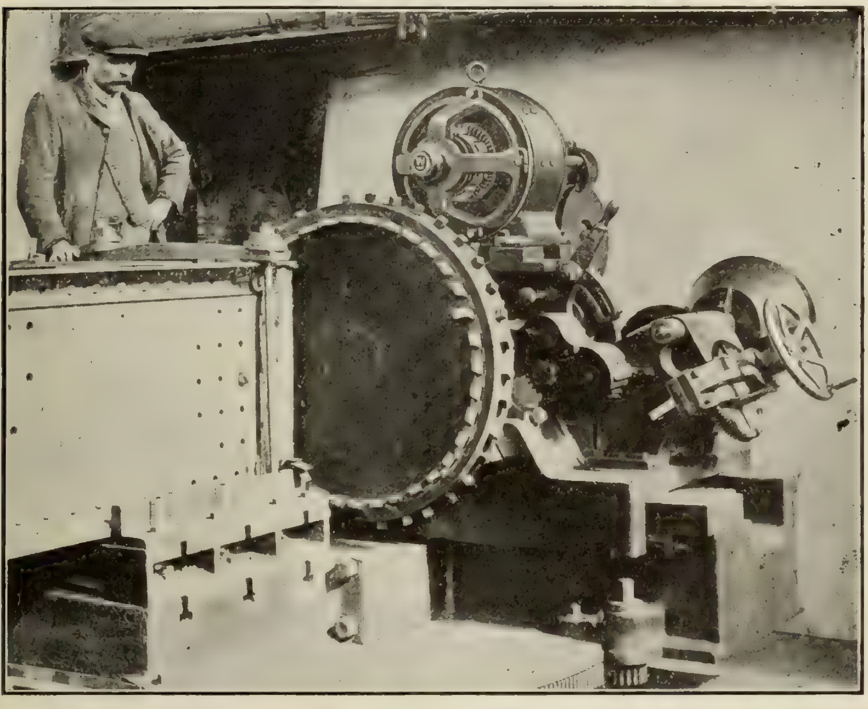
DRILL JIG AND FIXTURE DESIGN AND CONSTRUCTION.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

MOTOR DRIVEN ROTARY PLANER.

THE accompanying illustration shows an interesting form of planer for very large work, such as facing the ends of columns, cast iron bed plates, stringers, etc., and machining engine frames and other heavy castings. The cutting tools are arranged in a circle, which rotates when in operation. The machine shown can handle work 40 inches wide and 6 feet long. It is mounted on a circular base on which it can be turned, thus increasing the range of operation. It is manufactured by the Newton Machine Tool Works, Philadelphia, and is driven by a Westinghouse motor.



MOTOR DRIVEN ROTARY PLANER.

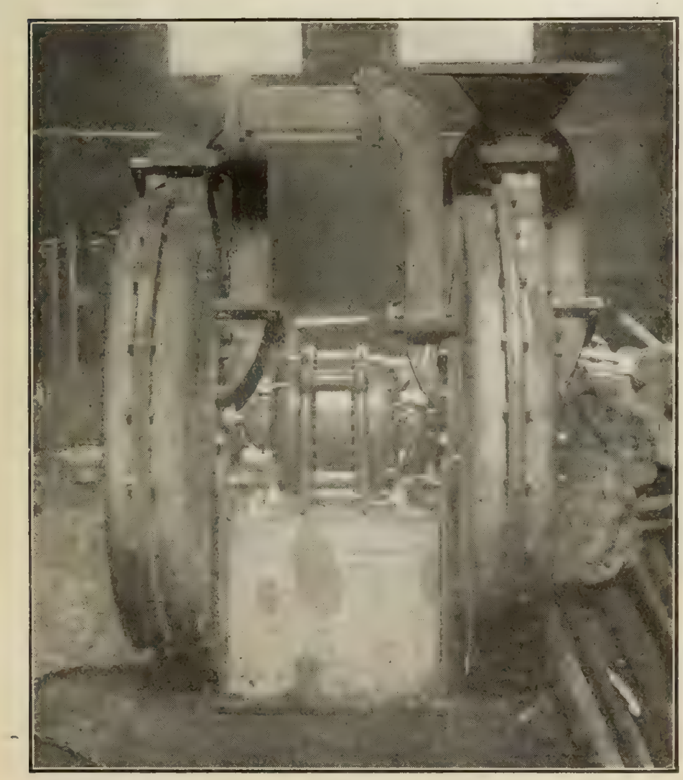
* * *

MOTOR DRIVEN PRESSURE BLOWER.

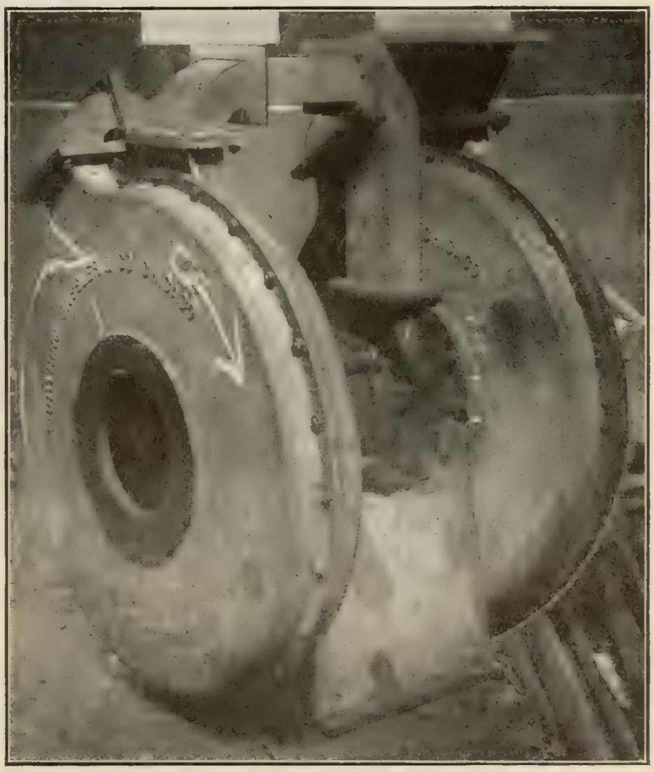
THE illustrations and data refer to a motor driven double battery blower, designed and built by the Bayley Mfg. Co., Chicago, Ill. When running at a peripheral speed of 14,000 ft. per minute, a pressure of 2 lbs. is available. Depending on the pressure required and motor speed available these blowers are made single, double, or treble battery, etc.

Among the considerations to which particular attention seems to have been given in the design of these blowers were the requirements of a general purpose blower; a blower suitable for cupola purposes, for oil furnaces and other work with minimum or maximum volume, and a motor driven unit.

The makers claim that not only is their product a constant delivery blower,

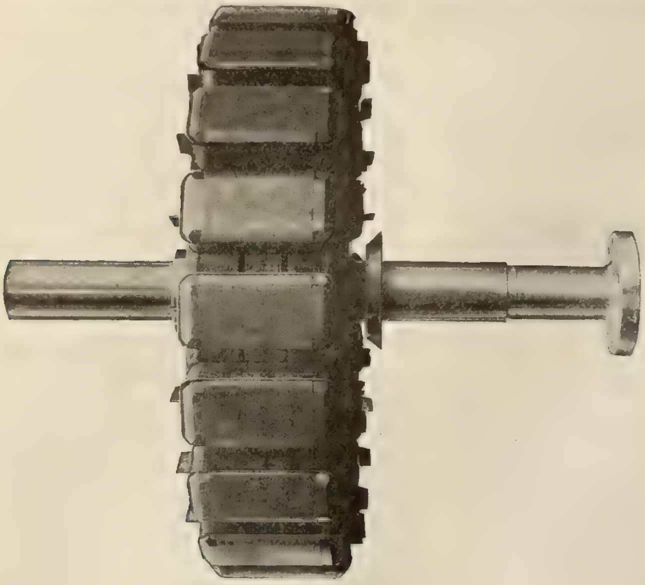


BAYLEY DOUBLE BATTERY BLOWER.

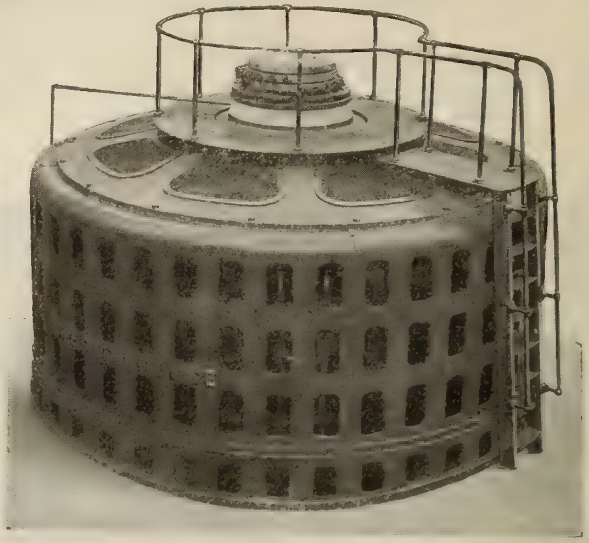


BAYLEY DOUBLE BATTERY BLOWER.

but it is positive in action up to the designed pressure—one, two, three, four and five pounds. A low tip speed, freedom from mechanical noise, high mechanical efficiency, air delivery relative to horse-power expended, therefore, unaffected by wear, absence of gears, safety valves, etc., are other directions in which highly satisfactory results have been achieved. Installations of this type of blower have been made covering gas booster service, for agitating heavy liquids, for burning oil in small units, for burning gas, and for blowing cupolas.

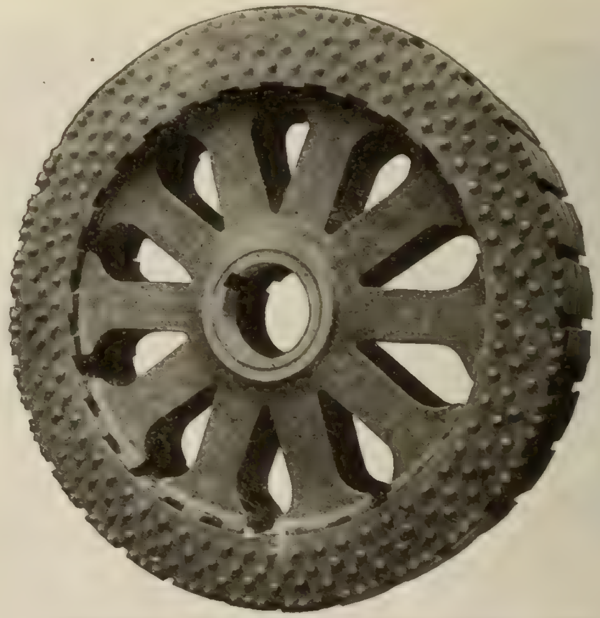


STEEL PLATE ROTOR



12,500 K.V.A., 6,600 VOLT, 50 CYCLE GENERATOR COMPLETE.

LAMINATED RIM ROTOR WITHOUT FIELD POLES.



LAMINATED RIM ROTOR WITHOUT FIELD POLES.

WATERWHEEL GENERATORS.

WATERWHEEL generators have recently been built to conform with the rapid development of hydraulic power for driving electric generators. The increased demands for such service require almost infinite combinations of capacity and speed range. Refinement in the design of both generators and waterwheels have made these changes possible; the successful operation of many high voltage transmission lines and the ever-increasing demand for power, all aid materially in the utilization of many water powers heretofore considered either impracticable or inaccessible.

Two types of waterwheel generators are built—horizontal and vertical, depending upon the local conditions in each case, and these, of almost any practical capacity or speed for installation in the smallest isolated plant or the largest hydro-electric generating station have been furnished by the Westinghouse Electric & Mfg. Co., Pittsburgh, Pa.,

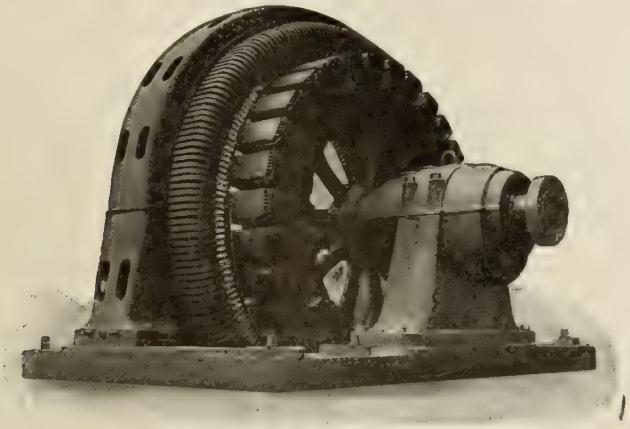
Horizontal Type.

The standard horizontal unit is of the two-bearing, coupled type construction; that is, the generator includes shaft, two-bearings and a bedplate usually designed to allow for sliding the stator to one side in case ready access to either the stationary or rotating winding is desired.

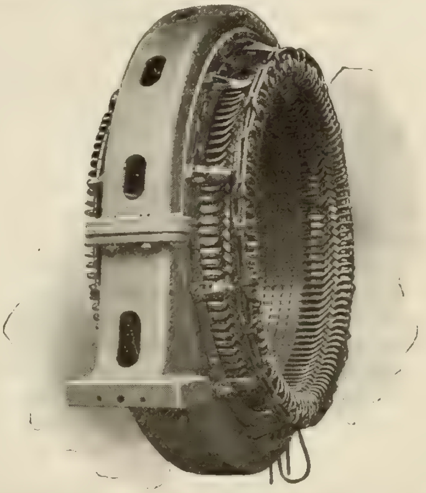
The stationary frame is a strong, rigid iron casting, into which soft steel laminations are dove-tailed and securely fastened..

Ventilating ducts are spaced at frequent intervals across the face of the armature punchings, allowing for perfect ventilation to all parts of the active material. Form wound, interchangeable armature coils fit into parallel open slots punched in these laminations, and the coils are held firmly in place by means of fibre wedges. The coils are insulated and impregnated with fabrics and compounds of high insulating qualities.

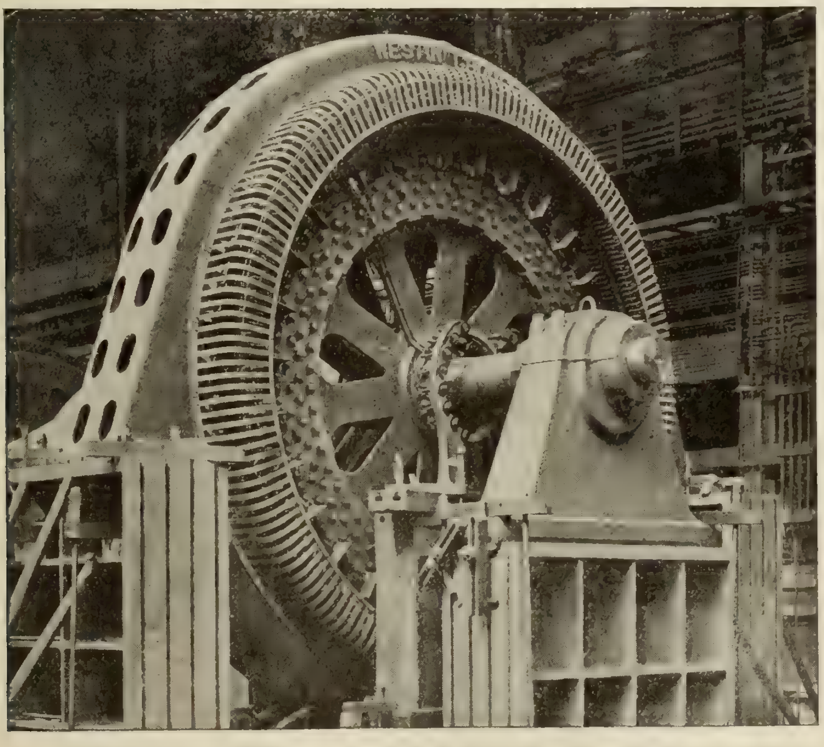
No single type of construction will meet the varied requirements in rotor design, therefore, several well tested methods are employed. When comparatively low peripheral speeds are encountered, a cast-iron spider with bolted-on, or dove-tailed poles, is usually employed. For higher speeds, cast steel or steel plate construction may be used. In the case of very large relatively high speed machines, the difficulty of securing perfect castings may lead to the well-proven laminated rim structure.



ARMATURE STRUCTURE FOR 1,000 K.V.A., 13,800 VOLT., 60 CYCLE UNIT.



SHOWING METHOD OF SLIDING STATOR TO ONE SIDE.



9,375 K.V.A., 6,600 VOLT UNIT IN SHOP TESTING RIG.

All field poles are made of thin steel laminations riveted together with overhanging pole tips provided to support the field windings. Field coils are wound of heavy copper strap on edge, insulated in such a way that each individual turn is exposed to the ventilating air, and thus perfect radiation results. The coil is securely fastened between the rotating spider and the tips of the field poles by heavy coil supports.

All parts are inspected during each step in the process of manufacture, and before the succeeding operation is started. When completed, the machine is tested under conditions, as nearly identical as possible, to those which its future service will demand.

Vertical Type.

Westinghouse standard practice recommends that the generator be fitted with two guide bearings which are supported by brackets fastened to the stator frame; also, a bedplate or pad on which the stationary part rests. The roller or thrust bearings which support the weight of the revolving part may be mounted on top of the generator frame between generator and turbine, or underneath the turbine. In case it is mounted on top of the generator frame, this frame must of course be made heavier and more expensive, than in cases where it has only to support the stator punchings, winding and guide bearings. Wherever placed, this bearing usually supports not only the rotor of the generator, but also the turbine runner, and in addition, takes care of any unbalanced water thrust. A rigid cast iron frame into which soft steel laminations are securely dove-tailed, forms the basis of the stator.

Form wound, interchangeable armature coils are held in open slots by means of fibre wedges. The coils are vacuum dried and impregnated before the outside insulation is applied. This outside insulation consists of wrappings of paper and mica on the straight portions of the coils which lie in the slots, and servings of treated cloth over the V-shaped coil ends. After the outside insulation is applied, the coils are treated with an insulating varnish which renders them moisture and oil-proof. An insulating cell is provided in each armature slot to prevent abrasion of the coil, and a fibre wedge holds coil and cell firmly in position.

In case of failure of a waterwheel governor to act, the rotating part of both waterwheel and generator are subjected to unusual stresses, due to the overspeeding of these parts. The rotors here illustrated are designed for the maximum obtainable speeds which result in such instances. These overspeeds vary from 50 to 100 per cent. Due to the wide range of speeds encountered, no one type of rotor construction will give ideal results. There are several designs of rotors, each one particularly well adapted for the requirements for which it is used. Comparatively low peripheral speeds may permit the use of a cast-iron spider with either bolted-on or dove-tailed poles.

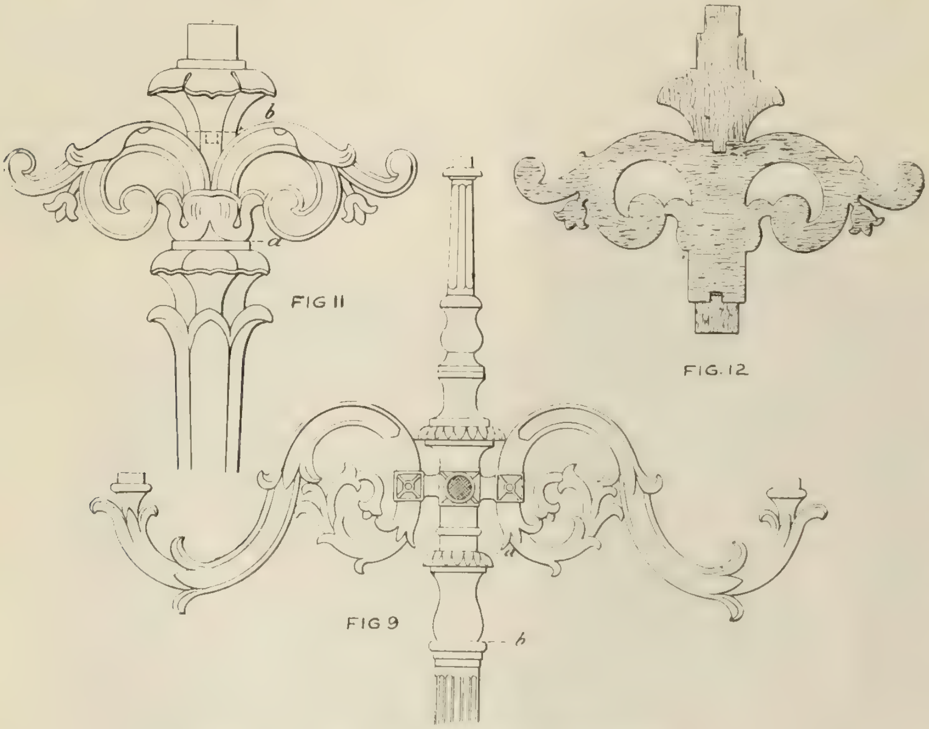
CARVED LAMP STANDARDS.—II.

By Joseph Horner.

IN the vast variety met with in the designs of columns, questions arise which have to be answered suitably to the particular circumstances of each. To this aspect of variations this article will be devoted.

Very many lamp standards have a cross-piece at the top. Whether it be required for the support of lamps or not, if for no other reason it is wanted to rest a ladder against, and this is usually made an occasion for ornament. Unless these are very short and plain, they are not usually cast with the main column, but are attached separately, like that illustrated in the last article. It is much easier and cheaper to treat them thus than to extend the sides of the column moulding box awkwardly to receive them, and to run the great risk of their becoming knocked off in the handling of the casting for fettling.



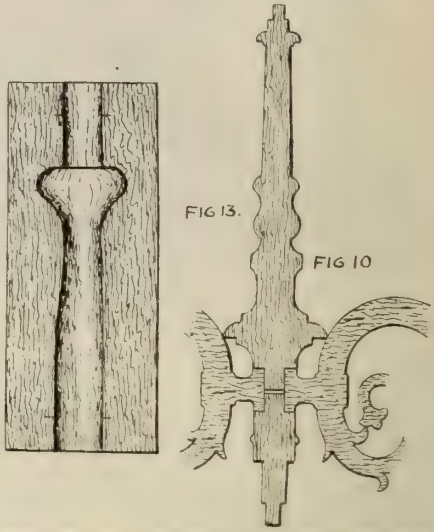
FIGS. 9, 11, 12. CARVED LAMP STANDARDS.

In much of this work the shortness of the timber grain in places renders careful handling necessary. Thus, in the standard top, Fig. 9, the termination of the stem or shaft and the scroll-shaped arms would be cast together, and the carving be done so as to avoid undercut and prevent the necessity of leaving any portions loose. The combined casting can be fitted into the top of the shaft either at (a) or at (b). The only way to make a decent pattern of this is as indicated in Fig. 10.

The arms are cut from one piece of stuff, and the upper and the lower portions of the stem are pinned and glued into it, after the manner shown in the Fig., which represents the jointed portion of one-half of the pattern lying open in the joint face. It is at the best somewhat flimsy, and for standard use it should be made in iron, but some hundreds might be moulded by plating a wooden pattern on an ordinary joint board. The halves of the pattern can be mounted on opposite sides of one board, or on separate boards, taking care to ensure their matching in the top and bottom moulds. Another way is to model a half pattern on a board in clay and cast pattern halves from that.

To get symmetrical shapes in wood the curves are marked preferably on one joint face first, which is then sawn round with a bandsaw, and the second half cut from that. The curves may be marked directly on the wood, but it is better to mark them on paper, folding the paper in a line which corresponds with the centre or axis of the column, and then, having cut to the lines with a penknife or small scissors, unfold it and glue it on the joint face of the pattern. Both sides will then be quite symmetrical.

Having cut round the edges, the carved faces are next treated, using gouges chiefly of various curvatures, vee tools for veining, and chisels in places. The eye judges of results, opposite sides being compared for symmetry, and kinks and flats being all merged in flowing curves. The real work must be done with the cutting tools—the rasps, rifflers and glasspaper being reserved for smoothing only.



FIGS. 10, 13. CARVED LAMP STANDARDS.

An alternative design is shown by Fig. 11. This is not so slender as the last, and is, from the patternmaker's point of view less troublesome to make. The jointing to the column is at (a). The pattern parts are jointed at (b) with a stud. Fig. 12 shows the half pattern

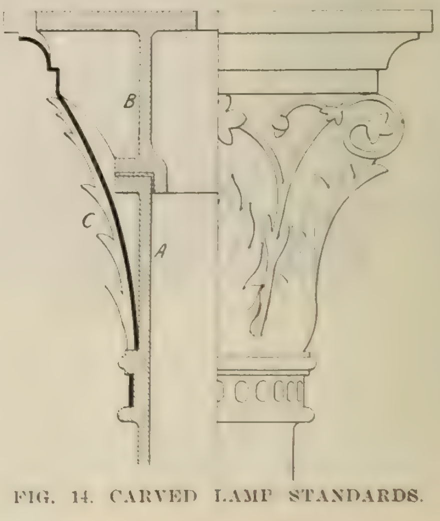


FIG. 14. CARVED LAMP STANDARDS.

open in the joint face with the spigot by which it is socketed into the main shaft, and the core prints.

When a considerable difference exists in the diameters, it is better to make a core to follow the outlines instead of putting a straight one through. The core can be swept against the edge of a board if only a few castings are required, but for standard work a box should be cut out, Fig. 13. A half box will answer well enough, the half cores from which will be pasted together. If an entire box is made to core out the cross arms, as in Fig. 8 in the last article, the core cannot be rammed from the ends, but each half must be rammed from the joint face and pasted together. The box must be battened across the back to prevent it from curving crosswise.

The carved work on highly ornamental capitals often occasions much difficulty. Several courses lie open. One is to cast the capital on the shaft, design the foliation to entail the least possible amount of undercut, and so leave the fewest pieces necessary to be loosely wired on. Not very much can be done in this way in highly foliated designs.

Another way is to cast the capital distinct from the shaft; then, being unattached, a great deal can be done in the way of main longitudinal jointing, supplemented by small loose pieces. A Corinthian capital may be moulded thus, but the pattern work is very expensive and the moulding very tedious.

A third way, very commonly adopted, is to cast the foliations in pieces separate from the cap itself and screw them on. These may then be cast thin, in brass, without the liability to fracture of thin iron castings. Fig. 14 shows how a column of this kind can be built up. The shaft (A) of the column is parallel, terminating in a flange. To this, the skeleton of the upper part of the capital is bolted, and on these, as shown, the strips of foliations (C) are screwed with stove screws. These are readily cast in malleable iron, or in brass. Being thin, they are not very expensive if in brass, and if the lines of joints show, they can be pened down or filed.

◆

BRIDGE BUILDERS' CONVENTION.

THE Twenty-Third Annual Convention of the American Railway Bridge and Building Association was held in Montreal, October 21-23. This is the second occasion on which the convention has been held in Canada, that of ten years ago having taken place in Quebec. The Windsor Hotel was chosen as the Association's headquarters, and here a large number of delegates assembled under the presidency of Mr. A. E. Killam, of Moncton, N.B. During the first day a considerable amount of business was transacted, three sessions being held. Over one hundred new members were elected, a large number of them being Canadians.

A formal welcome to the visitors was extended by Mr. William McNab, assistant chief engineer of the Grand Trunk Railway, in his address, which opened the morning session. He spoke of the tie between the Americans and Canadians who were engaged in the same branch of work, and the beneficial influences of such a gathering, referring to the technical and social elements entering into the proceedings. It was appropriate that the Convention should take place in Montreal, where, in the immediate vicinity, were two noteworthy bridge structures, one being the Victoria bridge; the other the C.P.R. bridge, which had just been rebuilt and double-tracked, remaining in service while this work was being done.

The President of the Association, who also welcomed the members to Montreal, referred to the history of the organization and its last meeting on Canadian soil, speaking of the value of the technical reports, and expressing his satisfaction at the work of the various committees.

An extensive programme of entertainments for the delegates and their families was carried out. This included a drive around Mount Royal, a theatre party, and a trip down the Lachine rapids. More serious items on the programme took the form of visits to the two bridges across the St. Lawrence. An inspection of the large plant of the St. Lawrence Bridge Co. at Rockfield was also made. Here were seen in course of construction the component parts of the great cantilever bridge that is to span the St. Lawrence at Quebec. The visitors were very favorably impressed with this plant, which is, without doubt, one of the finest of its kind on the American continent.

At the final session of the Convention on Thursday morning, October 23, the following officers were elected for the ensuing year:—President, J. N. Penwell, L. E. and W. Railway, Tipton, Ind.; first vice-president, L. D. Hadwen, C. M. & St. Paul Ry., Chicago; second vice-president, G. Aldrich, N.Y., N.H. & H.R.R., Boston, Mass.; third vice-president, G. W. Rear, S. P. Co., San Francisco, Cal.; fourth vice-president, C. E. Smith, Mo. Pac. System, St. Louis; secretary, C. A. Lichty, C. & N. W. Ry., Chicago; treasurer, J. P. Canty, B. & M. R.R., Boston.

◆

Sir Alexander Binnie has been elected engineer-in-chief of the Ottawa Gatineau Lakes water scheme, the employment fee being $400,000, out of which Sir Alexander is to pay his small army of subordinate engineers and inspectors.

Recent Judicial Decisions

Ottawa, Ont.—Mr. Justice Cassels has handed down judgment in the matter of the petition of Gebr Noelle of Ludenscheid, Germany, manufacturers of Britannia metalware goods, for an order of the court declaring them entitled to register a general trade mark consisting of the word "Albaloid," as applied to the various articles manufactured by them. Previous to filing their petition in the Exchequer Court the Minister of Agriculture had refused to enter the Noelles' mark in the register of trade marks, on the ground that a prior general trade mark consisting of the word "Albolene" had been registered by McKesson & Robbins, wholesale druggists of New York. The judgment handed down refuses registration of a general trade mark, but authorizes the registration of a specific trade mark consisting of the word "Albaloid," as applied to the metalware goods manufactured by Noelle Brothers, the petitioners. The case is the first to arise in the court where the registration of a general trade mark is asked for, which might conflict with a prior general trade mark on the registry. The learned Judge expresses the opinion that once a general trade mark has been registered for a particular word, the same word could not be registered as a general trade mark by anyone else. He holds that a general trade mark covers all the classes of merchandise in which the applicant deals, but that registration of a general mark does not confer an unlimited right the world over to exclude other persons carrying on business of an entirely different character from obtaining a specific trade mark of the same word or device as applied to the particular goods they manufacture, and which the owner of the general mark does not.

◆

A Port Arthur Protest.—The alert Board of Trade at Port Arthur, Ont., and many private firms in the city are making strenuous objection to the steps being taken to bring the new steamer Noronic to Sarnia to be completed. The Port Arthur people point out that the Shipbuilding Company received a bonus from that city, and that the inducements were the employment that would be offered to the citizens, and supplies that would be bought, etc. They claim that the removal of the boat means that nearly two hundred men will be employed in Sarnia all winter, that otherwise would be employed in Port Arthur, with a corresponding loss to the business revenues of the town.

TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada
To Achieve and Maintain a Dominant Place in the Markets of the World.

CANADA'S GREAT FIRE LOSS.

THAT the fire loss of Canada per capita is higher than any other country in the world is shown by statistics issued in a Conservation Commission bulletin.

The per capita loss in Canada in cities of over 20,000 population last year was $2.88, as compared with $2.55 in the United States, 54 cents in England, and 84 cents in France.

''Unless there is loss of life, our Canadian public regards destruction of fire with altogether too much complacency,'' says the bulletin, and goes on to state that many of the larger structures in Canadian cities are not built with a due regard for safety. The following table of comparative fire losses in different countries, during 1912, tells its own story:

Cities Over 20,000 Population.

	Cities reporting	Population	Per capita loss
Canada	5	957,372	$2.88
United States ..	300	32,326,633	2.55
England	12	7,164,849	0.54
France	6	4,425,696	0.84
Germany	9	2,659,575	0.20
Ireland	2	699,802	0.57
Scotland	2	485,091	0.49
Italy	3	282,082	0.90
Russia	2	3,485,583	0.84
Austria	4	2,658,978	0.30

FEDERAL REVENUE INCREASE.

REVENUE figures for the first seven months of the year show that the receipts have been $96,191,614, or some five millions more than in the corresponding period of last year. The excise and post-office revenues show an increase of a million, while the Customs figures are about the same as last year. The takings in the Railway and Canals Department lead those of last year by $1,300,000, while the miscellaneous revenues, derived from sales of land, etc., show heavy advances.

Detailed reports of Canadian trade for the first five months of the present fiscal year show that Canada's imports from and exports to the United States for the five months totalled $243.202,226, or nearly 60 per cent. of the Dominion's total trade with the world. Trade with Great Britain totalled $133.879.408, and with the British Empire $152.110.069.

Imports from the United States for the five months totalled $186,384,959, as compared with $61,070.476 from Great Britain, and $286,184,572 from all countries. Exports of Canadian products to the United States totalled $56,817,267, and to Great Britain $72,808,932.

Canada's sales to British Dominions and Colonies during the five months totalled nearly $11,000,000.

BRITISH EXHIBITION TRAIN.

AS previously announced, it is proposed that an exhibition train of British manufactures should travel through Canada next year. Up to date, the idea generally favored is that there should be eight exhibition cars and sixteen salesmen. It is suggested that it would be better that the large cities in the United Kingdom should each hire a car than that each special trade should have a conveyance of its own. It is recommended that exhibits be in such a form as will enable them to be constantly changed, and, further, in order to ensure freshness of display, alternate exhibits are desirable.

Two-Day Stands.

The exhibition train will stay in a town at least two days, and in the more important centres a week or longer. This will give ample time for all articles to be shown in each town. A firm, therefore, may have two independent sets of exhibits to be shown alternately, or they may appear turn and turn about with another firm, thus halving the expense. Practically everything that can be shown in a store window or carried by a traveller, can be exhibited. Makers of heavy machinery can show models, and, of course, photographs.

Of the $150,000 necessary, the Canadian Pacific Railway charges will come to $75,000.

CANADA NEEDS U.S. COAL.

COAL exportation of the United States for 1913 will approximate $100,000,000. This places them third among the coal exporting countries of the world, being exceeded only by the United Kingdom and Germany. Anthracite coal comprises about one-third of the total exports, and goes almost exclusively to Canada. For bituminous coal, Canada also is a large customer, taking eight and a half millions out of the twelve million tons exported in the eight months ending with August.

MINERAL DEVELOPMENT IN ONTARIO.

''THE mining industry of Ontario continues to expand, not only in quantity and value of the annual production, but also the area embraced within its operation,'' says Thomas W. Gibson, Deputy Minister of Mines, in his statistical review of the Bureau of Mines for 1913.

Returns made by mining Companies and mine owners show the aggregate production of minerals to have a value of $48,341,612, against $41,976,797 for the year 1911, or an increase of $6,364,815, or 14.9 per cent.

The wages paid in mining operation totalled $8,392,907. Of this amount $3,543,419 was paid to silver mines operatives, $1,245,361 to gold mines operatives, and $2.404,889 to nickel mines operatives. There are 9,362 employees in the mining industry.

The total production of metals in Ontario has a representative value of $225,706,378, and if the nickel and copper were valued at the prices of the refined metals in New York according to methods employed by the Department of Mines at Ottawa, the total would be about $290,000,000.

Product.	Value.
Gold	$ 4.734.713
Silver	97.176.289
Platinum and palladium....	290,755
Cobalt	1.072.141
Nickel	41,012,763
Copper	17,239,531
Iron ore	6.724.385
Pig iron	57.246.101
Lead	117.290
Zinc ore	92.410

Since 1894, when the first silver was obtained from the mines at Cobalt, the production of the camp has amounted in all to 155.815.839 ounces, representing a value of $81.731.115. The high prices of silver in the year 1912 resulted in the distribution of large dividends to shareholders of silver mines.

Dividends of $9.324.049, or $590.091 more than in the previous year, went into the pockets of shareholders, bringing the total amount of dividends and bonuses, not including the profits made by private owners, up to $39.834.740. Profits made by private owners would aggregate nearly $5.000.000 more.

Producing Mines.

The producing mines numbered 30 as against 34 in 1911, those having an output of a million ounces or more being:

Mine Name.	Ounces Shipped.
Nipissing	4,719,578
Coniagas	3,703,942
La Rose	2,920,344
Crown Reserve	2,714,766
McKinley-Darragh-Savage	2,704,868
Kerr Lake	1,895,309
Buffalo	1,890,150
Cobalt Townsite	1,505,396
Timiskaming	1,242,243
Cobalt Lake	1,123,146
O'Brien	1,091,631

Cement.

The cement produced in Ontario last year amounted to 2,993,367 barrels, representing a factory price of $3,365,659, an increase of 17,482 barrels, or $74,893 over the production of the previous year.

* * *

CANADA'S WHEAT.

At the end of September, reports to the Census and Statistics Bureau gave the total estimated wheat production of Canada for 1913 as 207,575,000 bushels, an increase of 8,339,000 bushels over the yield of 1912. The yield per acre was 21.15 bushels, as against 20.42 last year. The total yield of oats was 391,418,000 bushels, an increase of 30,000,000 bushels; barley, 44,348,000 bushels, an increase of 344,000 bushels; rye, 2,559,000 bushels; peas, 3,974,000; flax, 14,913,000; corn, 14,086,000 bushels.

For the three North-West Provinces, the total yield of wheat is estimated at 189,116,000 bushels; oats, 39,595,000 bushels; barley, 27,904,000 bushels; rye, 686,000 bushels.

NEW GOVERNMENT ELEVATOR AT PORT ARTHUR, ONT.

The new Dominion Government terminal elevator at Port Arthur, Ont., is now ready and in operation. It is the result of a long agitation by Western farmers who wanted the guarantee of the Government behind the marketing of their grain at the Head of the Lakes. The people's elevator, as it is known locally, will be the standard for many years to come. It is absolutely the last word in elevator construction, is the biggest individual elevator in the world, and brings Port Arthur's elevator capacity up to 15,350,000 bushels. There is also a large capacity at the sister city of Fort William.

Constructional Features.

The elevator is of reinforced concrete construction throughout and fireproof. The machinery is operated by electric power, a separate motor being installed for each unit. Twenty cars can be unloaded simultaneously, the unloading capacity of the house being forty cars per hour. An interlocking device connecting the valves of the car hoppers prevents any possibility of the mixing of the contents of one car with another.

The normal loading capacity to boats is about 75,000 bushels per hour, but for the first hour this can be increased to 115,000 bushels. The working house towers to a height of 185 feet above water level, and contains 75 circular bins of about 7,000 bushels capacity each, 56 interspace bins of 3,000 bushels, and 36 outer space bins of 1,500 bushels each. The total capacity is about 750,000 bushels.

The storage house has 70 circular bins, each 24 feet in diameter and 90 feet in height, of 30,000 bushels' capacity, together with 54 inter-spaces of about 8,000 bushels each, giving a total capacity of 2,500,000 bushels. The total capacity of the elevator is, therefore, 3,250,000 bushels. In designing the elevator, especial provision was made for a large number of bins of small capacity for storing small lots of grain that may require separate binning.

Cleaning and Drying Plant.

The working house is equipped with 10 hopper scales of 2,000 bushels each, with a garner of equal capacity over each scale. The elevator legs are as follows:—Five for receiving, 5 for shipping, 5 for cleaning, 1 for screenings, 1 for drying, 1 for oats, and 2 for flax. Fifteen sets of receiving cleaners are provided for cleaning oats, wheat, and barley, and 15 additional cleaners can be installed when needed. Special machines are also installed for separating oats from wheat, in addition to two screening separators and two flax separators.

Separate Drying Plant.

At the south side of the working house, a drying plant is installed in a separate building. This has a capacity of 48,000 bushels per day, and is for drying damp, tough or wet grain, and putting such grain in condition for storage.

A revetment wall is being built around three sides of the site, which contains about 32½ acres. The site was formerly covered by water, but it now filled in level with the top of the revetment wall.

CANADIAN VICKERS SHIPYARD AT MONTREAL.

IN our October 30 issue, considerable space was devoted editorially to the shipyard plant of the Canadian Vickers Company at Montreal. Mention was then made of the progress being made, and an outline sketch given of the projected capacity and final equipment and compass of the undertaking. We have since been officially informed that within the next two years the whole establishment will be completed, and, needless to say, the addition to Canada's industrial sphere of such an enterprise will open up new opportunity and afford extended scope to those developing our natural resources, and to the many others who will find direct and indirect occupation through its instrumentality.

◆

THE "LEONARD" SHOPS OF THE N.T.R. AT QUEBEC.

PUBLICATION is made in this number of our journal of an outline description of the principal features of note entering into the layout, construction and equipment of the new locomotive and car repair shops of the National Transcontinental Railway at Quebec, work on the erection of which was begun some weeks ago.

We note with pleasure that, in spite of the many changes of personnel in almost every Department of Canadian Government service, recently, the men who have been responsible for similar undertakings in the past, and who have carried these to successful completion and operation are again directing this latest installation. There is, of course, no particular credit due "the powers that be" for such an eventuality, no more was there any good and sufficient reason for making a change outside of finding room for a party "heeler."

The layout and equipment of the N.T.R. shops at Transcona, near Winnipeg, brought commendation from a wide circle of railroad and general mechanical engineering experts, for the facilities provided and the general advances made in different directions relative to efficient and rapid handling of raw and finished materials, and rolling stock. The experience gained in the layout of the Transcona plant was both unique and valuable, and was only possible of acquirement to the fullest extent by the guiding and directing engineer.

That such an experience has been appropriated is amply evident from this preliminary sketch of the shops, etc., at Quebec, and, while it is true that their completion and operation will, in the nature of things, suggest improvements considerably in advance of what is presently up-to-date, it is satisfactory to know that this latest plant will be without peer for its purpose, anywhere.

The midway feature of the Leonard shops is, we think, worthy of special notice and attention by those responsible for railroad equipment and rolling stock repair plants generally, due to the deviation from previous practice in its relation to the various departments which it is called upon to serve. When one comes to think of it, there is a feeling of surprise that the change had not taken place on the occasion of other plants' layout, and in looking for a reason for the continued adherence to the old arrangement, there is little beyond the fact that a deep rooted idea that raw material dumped at one end of a factory and leaving it at the other end as a finished product gave a concrete example of our highest conception of systematic manufacture.

It will be abundantly evident even to the uninitiated that the arrangement planned for the Leonard shops will far surpass the old method, and while this particular feature is the only one singled out for notice here, we are quite certain that in many other directions, there will be found improvements along the lines of higher degree system and efficiency, than have yet appeared in similar installations.

SELECTED MARKET QUOTATIONS

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Nov. 10, 1913.—No great increase in trade activity can be recorded this week. The iron market still rules dull, and most large manufacturing firms are retrenching as much as possible. It is to be feared that there will be a considerable amount of unemployment during the coming winter; in fact, the number of men out of work even now is above the average.

Last week rumors were current of specifications about to be issued on behalf of the Grand Trunk Pacific. These have now been received and prove to be much more interesting than was thought likely. They call for machine tool and other equipment for the G. T. P. ship repairing plant at Prince Rupert, B.C., and the total amount of money involved will run to approximately $200,000. This is by far the most important specification that has been issued for a long time, and needless to say all the machinery houses are busy figuring on it.

The Union Switch and Signal Co., Swissvale, Pa., have just been awarded a contract for automatic block signalling equipment for the Intercolonial Railway. The contract price was $85,000, and calls for signals for the most congested parts of three important divisions on the line, viz., St. John to Hampton, N.B.; Moncton to Painsec Junction, N.B.; and Windsor Junction to Halifax, N.S. Another important contract recently secured by the Union Switch and Signal Co. involves the installation of automatic block signals across the Victoria Jubilee Bridge of the G. T. R. at Montreal. The Canadian office of the Company is in the Canadian Express Building, Montreal, at present; but it is stated that next spring a fully equipped factory will be erected in the vicinity of this city, and a Canadian Branch of the Company will then be organized.

Last week saw the formal incorporation of Armstrong, Whitworth, of Canada, Limited, with a capital of $2,000,000. This firm have for the last six months been going busily ahead with their new plant across the river at Longueuil. The twist drill shop and many of the other buildings are now covered in; but the equipment is not yet installed, and no manufacturing will be done until late in next spring.

Metal Market.

The pig iron situation remains unchanged. Sales are scarce in Canadian and American pig, and there seems to be no near prospect of any improvement. Copper to-day is quoted around $15.75 in New York, which means about $16.25 here. This price is not likely to hold for long, however, and the next few days may see a return to the $17.00 mark.

Tin is a little easier, but there is not much doing. Lead remains very firm owing to the great scarcity of this metal just now.

Toronto, Ont., Nov. 11, 1913.—With all the slackness that has been experienced in the machine tool business, there are some propositions that must go ahead, and there are new firms who must buy machine tools. The Kelsey Wheel Co., of Windsor, will probably buy Thursday or Friday. They are a new concern connected with the automobile industry.

One of the biggest orders for this class of machinery was placed this week, it is stated, with Mussens, Ltd.—an order that struck terror into the hearts of those who lost it. It was placed by the Dominion Dredging Co., who have the contract for constructing Section No. 1 of the Welland Canal. For this they have purchased steam shovels, excavators, dredges, etc., as well as a large number of machine tools, the order amounting to about $350,000. This order is said to have duplicated their entire equipment at Montreal. With other contractors on the Welland Canal ready to proceed, there should be several other big orders available pretty soon. Most dealers are getting after this business, which will be the best of the season.

The Michigan Central Railway, who recently erected new shops at St. Thomas, Ont., are purchasing several new machine tools. Their specifications this week call for three radial drills, wheel presses, and several milling machines.

The Canadian Fairbanks Morse Co. will exhibit a number of electrically-driven machine tools at the Electrical Exhibition this week in the Arena.

Steel and Iron.

Too much reliance should not be placed on the quotation for steel bars, f.o.b. Toronto, which is given as 2.15. This is the Canadian mill price, and is owing to the condition of trade just now.

While the price of steel bars quoted in Pittsburgh is 1.30, only very desirable business is being taken locally at that price. The price quoted for less desirable business is 1.35, of 1.88 f.o.b. Toronto. This is about the rate the U. S. Steel Corporation can do business at in this city, and the Canadian mills must compete with them at that rate. Complaints are made by Canadian steel companies that the price of steel bars is being cut by the Americans, and in consequence the Canadian price of 2.15 may be expected to drop considerably before long. The price 1.83 quoted above is, of course, on carload lots and over.

The charge of cutting prices is not only laid against American dealers. Some of the big jobbers in the city are said to be reducing their stocks of steel bars and plates preparatory to taking stock in December. An agent, speaking of this yesterday, said: "They are simply trying to 'kid' themselves that they have sold more than they have. They might as well have big stocks in January as in December."

Those who usually buy steel are playing a waiting game again. Some say the market will strengthen; some say it will weaken. As a matter of fact, the price of steel is getting about as low as it can be to be sold at a profit. Business conditions are resembling those of two years ago, beginning in December, 1911, and lasting until January, 1912, when makers of steel were cutting one another's throats. It is probable, however, that they will get together before then, and agree to stiffen prices.

The new American tariff is having its effect on the market more by keeping American buyers from placing orders rather than resulting in keen competition from Europe. As the prices here are based on those in the States, the reaction is felt in Canada. Buyers are looking to Germany to come along with some cheaper material.

Drummond McCall & Co. report more business done in October than in the earlier months this year. Warehouse business is heavy. They do not expect to carry pig iron again for several months. Pig prices remain the same. Little building is going on. The nut and bolt works of the Steel Company of Canada, at Swansea, are only working four days a week.

Metals.

Frankel Brothers report copper down a cent a pound, a drop which has been taking place gradually since Thursday last. They think the price will drop further. Why the price has fallen nobody seems to know; it may be due to manipulation or due to less demand. The English market is down, and New York has dropped in sympathy. No business is being done, however. Dealers are neither buying nor selling—just sitting on the fence, waiting to see what will happen. No. 1 machine composition is down to $11.50 from $12.50, the fall being natural, since 80 per cent. of it is copper.

Coke and Coal.

Local prices of coke remain unchanged. The supply is fair, and the demand, considering the state of trade, has been remarkably good. The fact that a coke plant is being built at Hamilton should not influence foundrymen, since it is probable that only furnace coke will be made to get the gas.

St. John, N.B., Nov. 8, 1913.—A new nail-making industry is to be established in St. John. The Canada Nail and Wire Co., Ltd., composed of several leading citizens, has been organized with a capital of $400,000 to manufacture horseshoe nails in a plant to be established at Coldbrook, not far from the automobile works. It is possible that operations will be commenced this year. The provisional directors are W. A. Johnston, R. L. Johnston, W. A. Coles, G. M. Johnston and F. E. Marvin.

F. H. Anson, president of the Atlantic Sugar Refineries, Ltd., was in the city yesterday from Montreal in company with E. G. M. Cape, contractor for the superstructure. Their visit had to do with plans to rush the work to completion, in addition to inspection of the work already done. Mr. Anson said that the difficulty of getting the structural steel on time, had caused a delay, but he expected most parts to be completed easily upon time. Every possible effort would be made he said to have the building rushed to completion.

An event of much importance in the industrial history of St. John, was the announcement made this week by J. A. Pugsley, general manager of the Maritime Motor Car Co. prior to his departure for England, that the Ford Motor Co. intend coming to this city and would locate at Coldbrook. Negotiations for the lease of the big plant of the Maritime Motor Co., at Coldbrook have been in progress for some time, and various rumors have been received with interest, but an official announcement was not made until this week that the deal had gone through.

Mr. Pugsley said that plans would immediately be prepared for a new factory for the Maritime Motor Co. in the spring which is another announcement of leading importance. Until this is completed, he said the company would continue to ship their cars from the American factory of the Palmer & Singer Mfg., at Long Island City, N.Y., with which Company he said his concern had become affiliated. Mr. Pugsley also said that he and Malcolm Mackay, jr., were intending to leave at once for England, and upon their return, he hoped to be able to announce the coming of more English and Canadian industrial concerns to St. John.

A modern electric lighting system has just been completed and installed at Grand Falls, N.B. The town has erected a large concrete sub-station, and has installed an electric pump in connection with the water-works system to replace the steam pump which was not considered of sufficient power. The power is supplied by the Main & New Brunswick Electrical Power Co., whose power house is at Aroostook, Falls, N.B.

The drilling operations for natural gas at Sussex, in progress by the Maritime Oilfields Co., has been abandoned until the spring, when work will be resumed. The company reached a point twelve hundred feet down, and it is expected that another three hundred feet will show a good flow of gas. The indications are encouraging, but the drillers and other employes of the company engaged at Sussex, are needed at Stoney Creek, near Moncton, N.B., where the gas boring is more extensively developed.

EXPENDITURES AT CANADIAN PORTS.

THE Public Works Department will call for tenders in a few days for the construction of concrete piers at Victoria, B.C., to cost $2,000,000. This is another step towards the Nationalization of Canadian Ports on which the Government is now spending money by the tens of millions. The new piers at Victoria will be constructed in the outer harbor, within a shielding breakwater, and the work as now planned, aggregating a total expenditure of over $5,000,000, will provide for the growing shipping of the port for years to come.

Millions are being spent also on Vancouver harbor, besides some $700,000 on the dredging of False Creek within the harbor. At Esquimalt also the Government purposes building a huge drydock 1,150 feet long, similar to that at Levis for which the Prime Minister last Friday turned the first sod.

Other Big Expenditures.

Other immense Federal Expenditures on ports include the Toronto harbor improvements, costing $5,000,000, and the contracts recently awarded for three sections of the new Welland Canal. These total about $19,000,000, or a third of the total cost of the Canal.

Besides the important improvements planned at Montreal harbor, costly works are being undertaken also at Quebec, both by the Public Works and Railway Departments.

St. John and Halifax.

At St. John, N.B., improvements are now under way that will total about $30,000,000, while at Halifax the terminal works to be built by the Department of Railways and Canals will cost probably $15,000,000 or $20,000,000, including the docks, three miles of railway, necessary buildings, etc. Saturday was the last day for receiving tenders for the first unit of these vast improvements.

◆

Pigeon, Pigeon & Davis, patent solicitors, St. James Street, Montreal, report that 165 Canadian patents were issued for the week ending October 28th, 1913, 100 of which were granted to Americans, 35 to Canadians, 18 to residents of foreign countries, and 12 to residents of Great Britain and colonies. Of the Canadians who received patents, 19 were residents of Ontario, 8 of British Columbia, 4 of Quebec, 1 of New Brunswick, 1 of Manitoba, 1 of Saskatchewan, and 1 of Alberta. In the United States, for the same week, 590 patents were issued, 16 of which were granted to Canadian inventors.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Hamilton, Ont.—The Boston Insulated Wire Co., Shaw Street, are planning a $5,000 addition to their plant.

Milton, Ont.—The Imperial Foundry Co. new building near the C. P. R. station is ready for the roof.

Sarnia, Ont.—Harry W. Loughead has purchased property on North Front Street for an extension to his machine shop. New machinery has been bought.

Saskatoon, Sask.—The Metal Shingle and Siding Co., of Saskatoon, Ltd., has been incorporated at Regina, with $500,000 capital.

Walkerton, Ont.—Work has begun on the foundry and repair shop, one storey, 40 x 50, for Ellenhauser Bros., to cost $5,000.

Windsor, Ont.—The No Draught Ventilator Co., of which E. J. Post, Staunton, Va., is secretary, will erect a factory here.

Windsor, Ont.—Construction work on the plant of the Swedish Crucible Steel Co. has been delayed owing to difficulty in obtaining a supply of steel.

Toronto, Ont.—The Pedlar People of Oshawa, Ont., have secured a 10 years' lease on the basement floor of the new Art Tailoring Building on Markham and College Streets.

Selkirk, Man.—The Manitoba Rolling Mills Co., who are erecting a plant here, are taking 50 h.p. from the municipal plant, and will take 400 h.p. when the plant is finished.

Fort Erie, Ont.—D. J. Johnson is acting for the motor car firm who propose to erect a plant here. He is also trying to induce some makers of metal office furniture to locate.

Vancouver, B.C.—George Wolf, jun., of the Geo. Wolf & Son Steel Mfg. Co., Bathgate, Scotland, who have a branch in Montreal, says his firm may extend their operations to Western Canada.

St. Catharines, Ont.—The Dominion Dredging Co., Ltd., announce they are erecting a machine shop, using their own labor, and have purchased all necessary machinery. E. A. Larmonth is manager.

Toronto, Ont.—The Consumers' Gas Co., of Toronto, inform us that plans for the enlargement of their works have not yet been completed. Edward Jackman is purchasing agent.

Smith's Falls, Ont.—An automobile firm through A. B. Scott, of the Board of Trade, have asked the town to rent the Tudhope-Anderson works, and give it to them rent free for a few years. On these conditions they would move to Smith's Falls.

Toronto, Ont.—The Rock & Power Machinery, Ltd., has been incorporated at Ottawa, with capital of $500,000, to manufacture machinery of all kinds, and to act as agents for same. Incorporators—Allan Gilmour, Archibald Cochrane, barristers, Toronto.

Victoriaville, Que. — La Compagnie Jutras, Ltd., incorporated at Ottawa, capital $100,000, to manufacture manure spreaders, maple sugar evaporators, and farming implements. Incorporators—Charles B. Jutras, Woodward Jutras, etc.

Hull, Que.—The Hull Iron & Steel Foundries, Ltd., have been incorporated at Ottawa, with capital $250,000, to acquire and take over as a going concern the undertaking and business now carried on at the city of Ottawa by A. H. Coplan as brass and steel founders.

Regina, Sask.—The Norris Burnett Co., of Potowski, Mich., wish to move their machine shops here. If given financial assistance they will build a shop 40 x 50 ft., two storeys high, and employ 20 men.

Ottawa, Ont.—The Campbell Steel & Iron Works, Ltd., makers of structural steel, boilers, tanks, etc., have commenced work on an addition to their plant, which will double their capacity. All machinery has been purchased.

Le Pas, Man.—Next spring work will start on the roundhouse and machine shops for the Hudson Bay Railway, plans for which have been prepared. The location of the station has not yet been determined. It is said $75,000 will be spent on this building, which is to be completed by January 1, 1915.

Medicine Hat, Alta.—The third annual meeting of the Alberta Rolling Mills, Ltd., was held on November 3. It was decided to go ahead with the erection of the bolt plant here. About a million dollars will be spent on this building, which will measure 70 x 150 ft. J. L. Pollock is president.

St. John, N.B.—The Canada Nail and Wire Co., Ltd., has been incorporated in New Brunswick, with head office in St. John, to make wire, wire nails, spikes, screws, bolts, tacks, etc., with $400,000 capital. Provisional directors are:—Wm. A. Johnston, St. John; Robt. L. Johnston, Gordon McR. Johnston, and Frederick E. Marvin, nail maker.

Calgary, Alta.—The North-Western Brass Co., Ltd., East Calgary, have completed a foundry, 200 x 100 ft., and started operations. There are twenty furnaces, served by car tracks. The other departments are pattern room, core ovens, machine shop and assembling room. The plant cost $250,000. A. G. Meaden is manager.

Montreal, Que.—The management of the Canadian Vickers Co. report that the foundations of the new shipbuilding slipway at the site of the floating shipdock at Maisonneuve have been laid. The structural work for the slipway, which will be 390 feet wide over all, is now in process of construction at the works of the Dominion Bridge Co.

Lindsay, Ont.—The Canadian Boving Co. have started work on the foundations for an extension to their machine shop. The building will be completed before winter sets in. The Company have purchased some machine tools, but have not yet bought the full equipment. Specifications for cranes were considered last week.

Winnipeg, Man. — Henry Birks & Sons, Ltd., and the Porto and Marble Co., jewelry manufacturers, who have amalgamated, will establish a jewelry factory here, and instal die presses, drop hammers, machinery for drilling and turning, smelting furnaces for assaying and refinishing, draw benches for making gold and platinum wire, etc.

Winnipeg, Man.—A corporation, capitalized at $1,000,000, has been organized here for the manufacture and sale of the Bull tractor,a general utility gasoline tractor on three wheels, which will sell for $485. The officers are:—W. H. McWilliams, president; Alex. R. Hargraft, vice-president, and J. S. Lowden, secretary. D. S. Hartsough, of Minneapolis, inventor, and patentee, is understood to have taken a large block of the stock.

Montreal, Que.—The Canadian branch of the Armstrong-Whitworth Co., one of the great shipbuilding concerns of Britain, has been incorporated at Ottawa, preparatory to the commencement of operations in this country. The incorporators named are Sir Percy Girouard, K.C.M.G.; Sir George Herbert Murray, C.B.; Sexton William Armstrong Noble, George G. Foster, K.C.; John A. Mann, K.C., and M. J. Butler, C.M.G. The capital is placed at $2,000,000.

Electrical

Brockville, Ont.—The town will spend $69,000 to extend the light and power systems.

Fonthill, Ont.—Arrangements are being made to have the village lighted by electricity.

Fergus, Ont.—The village will borrow $10,000 to establish a local distributing plant to utilize hydro power.

Fergus, Ont.—This village will spend $16,000 on Hydro-Electric power, and the village of Elora, Ont., will take 200 h.p. and spend $10,000.

Regina, Sask.—The Estevan Transit and Power Co., Ltd., will apply for incorporation in Saskatchewan as a power and railway company.

Smith's Falls, Ont.—The council have decided to ask the Hydro-Electric Commission to develop power from Long Rapids on the Madawaska River, and transmit it to Smith's Falls.

Brantford, Ont.—Engineer J. J. Jeffery of the Ontario Hydro Commission has been inspecting Parkdale, Grandview, Echo Place and Paris Hill in response to the petitions from these places for electric energy.

Grand Falls, N.B.—The town has just completed the installation of an electric lighting system. Power is supplied by the Maine & New Brunswick Electrical Power Co., whose power house is at Aroostook Falls, N.B.

Galt, Ont.—Three more transformers have been placed in the Dickson Street hydro sub-station, making six there, and, with three in the Getty & Scott sub-station, Galt has now a transformer capacity of 1,800 horsepower.

London, Ont.—The London Street Railway has signed a contract with the City of London and the Hydro-Electric Commission of Ontario for from 1,000 to 3,000 h.p. to operate its lines. The company will use direct current.

Mirror Lake, B.C.—The Mirror Lake Electric Light Co., Ltd., have installed a light and power plant here. The equipment purchased consisted of an Edison 35 k.w. 110-volt generator and attachments. The wiring and other work were done by W. R. Godfrey of the McKenzie Electric Co., Lethbridge.

The Rudel-Belnap Machinery Co. have located their Toronto office at Room 10, Tanner & Gates Bldg., 28 Adelaide St., West. Mill, mining, machine shop, railway and contractors' machinery and equipment will be sold from the Toronto office, which is in charge of Mr. A. E. Juhler.

Toronto, Ont. — The contract to sell the T. Eaton Co. 2,500 horse-power per annum represents one of the biggest individual contracts yet signed by the Toronto Hydro-electric Commission. The cost to the company will be in the neighborhood of $30,000 per annum, and the Commission states that it will have to increase its supply from the Ontario Power Commission in order to cope with the increased demand.

General Industrial

Irvine, Alta.—The Ogilvie Milling Co. elevator at Irvine was burned Oct. 31.

Wilkie, Sask.—F. L. Bishop, Strome, Alta., will erect a flour mill, costing $10,000.

Winnipeg, Man.—The Provincial Government will spend $2,500,000 on good roads in this province.

Victoria, B.C.—The British Columbia Gypsum Co., Ltd., have been incorporated here to work this product.

Toronto, Ont.—W. Harland & Son, 400 Eastern Avenue, will erect a $6,000 plant for the manufacture of varnishes.

Sherbrooke, Que.—A Levis shoe manufacturing Company, employing 154 hands, will move here if given a $15,000 bonus.

Porcupine, Ont.—Twenty more stamps will be installed at the Hollinger Mine next spring, and the new central power plant will be pushed.

Windsor, Ont.—The American Chemical Co., of Cincinnati, Ohio, will establish a Canadian branch at Ford to handle North-West trade.

Saskatoon, Sask.—The Saskatoon Soap Co. will erect a new soap plant to make new lines. J. J. Manly is business manager.

Lake Megantic, Que.—Local farmers will organize a Co-operative Creamery Association and advertise for the building of a creamery in the Echo Vale district.

Clayburn, B.C.—The milk factory here is completed, and in the course of a couple of weeks the machinery will be installed. Another plant will probably be built by the same firm near Duncan, Vancouver Island.

Toronto, Ont.—The McBrien Leather Goods Co., of Berlin, have purchased for $25,000 the factory at 80 Duchess Street. The building is three storeys, with a frontage of 39 feet, by a depth of 100 feet.

New Westminster, B.C.—The Grain Growers' Grain Co., of Winnipeg, have purchased the elevator and business of the Grain Growers' B.C. agency here, and will probably extend it. C. B. McAllister is local manager.

New Westminster, B.C.—The Grinnell Glove Co., of Vancouver, has decided to establish a glove and leather goods factory at the corner of Mars Street and Wilson Road, Port Coquitlam; work to start at once.

Bridgeburg, Ont. — The Standard Crushed Stone Co., of Niagara Falls, will open up a 72-acre quarry at Windmill Point, near here, next spring, employing 50 men. Sims & Doyle, Queenston, Ont., will also open a quarry in the same vicinity.

Victoria, B.C.—The erection of a laundry at Kitsilano Beach in connection with the Park Board's system of bath houses will cost $3,400, according to a detailed estimate of the proposed building submitted to the finance committee of the City Council. The building will cost $1,400 and the equipment $2,000.

Sarnia, Cnt.—An Elevator Company, desirous of operating a large grain elevator at Sarnia or Point Edward, has written to Sarnia requesting information as to whether any inducements will be offered for location there. The Company has had an offer to build at another point, where there is an advantage in power and a low rate of taxation.

Niagara Falls, Ont.—The American Cyanamid Co. has been employing 650 men in operating its plant and 450 in building extensions. The new buildings include, besides duplications of the present process buildings, new offices, wash-house, laboratory, restaurant, hospital and a liquid air plant. The new plant will have a capacity of 60,000 tons per annum.

Building Notes

Oakville, Ont.—The town hall was completely destroyed by fire on Nov. 4.

Wood-Working

Leadville, Que.—C. N. Boright, Mansonville, is planning the erection of a saw mill.

Ridgeway, Ont.—Frank Sherk is building a planing mill on the Alex. Haun farm.

Fort Qu'Appelle, Sask.—The Fort Qu'Appelle Boat Building and Woodworking Co. is building a factory at a cost of about $50,000.

Royal Oak, B.C.—The shingle mill belonging to G. Fleming & Yeomans, Royal Oak, was destroyed by fire recently. The mill had only been in operation four months.

Westmount, Que.—R. T. Smith & Co., Hillsdale Avenue, Westmount, suffered loss by fire at their sash and door factory recently. The damage amounted to about $25,000.

Wyoming, Ont.—Preliminary work for the building of the box and basket factory by D. Senecal was commenced last week. The size of the factory will be 30 x 120 feet.

New Liskeard, Ont.—The National Pole Co., of Escanaba, Mich., have purchased seven acres for a plant to employ twenty-five men. The Company will erect a shingle mill later.

Vancouver, B.C.—The Everett Pulp & Paper Co. has been incorporated in British Columbia with head offices here. The capital stock is $672,000. The Company intend to erect a pulp and paper mill in British Columbia.

Quebec, Que.—The Beauce Pulp and Lumber Co., 68 Peter Street, Quebec, are considering plans for building a new mill at Scott Junction, P.Q., to replace the one which was recently destroyed by fire.

Brantford, Ont.—The Ham & Nott Co., Ltd., makers of refrigerators, screen doors, etc., have recently increased their warehouse space, and installed new machinery and boilers, at a cost of $10,000 to $15,000.

Stratford, Ont.—G. H. Strawbridge has purchased the carriage works at 134 Ontario Street. He will make furniture to order, and do band sawing, pattern making, and general repair work. New machinery has been purchased.

Chicoutimi, Que.—The British Industrial Co., owners of large timber limits on the Salmon River, intend to erect a large paper mill in the Lake St. John district, Quebec. The plant will be located on the Ashuapmouchouan River.

Stratford, Ont.—The City Council is considering a proposition from the Stratford Manufacturing Co. to practically double the size of its plant. The firm, which makes lawn swings, ladders, etc., asks the council to grant fixed assessment of $6,000 for ten years.

Montreal, Que.—The Chicoutimi Pulp Co. have been authorized to increase their capital stock to $1,500,000 from $1,000,000, but J. E. A. Dubuc, managing director, declares that no immediate extensions are contemplated. The Company has orders on its books to the value of $16,000,000, covering the output of the mills for eight years.

Morin Heights, Que.—The mills of the Argenteuil Lumber Co. have been totally destroyed by fire. The Company manufactured clapboards, shingles and lath. A small electric plant which supplied the district and mills with power and light was also destroyed. The damage is estimated at $30,000 with $10,000 insurance.

Dryden, Ont.—A meeting of the creditors of the Dryden Timber & Power Co. was held recently in Toronto, at which D. L. Mather, of Winnipeg, President of the Company, was appointed liquidator. It is reported that the Company will be reorganized and that the liquidator was authorized to borrow $200,000 to continue operations. J. B. Beveridge will continue as manager.

Contracts Awarded

Welland, Ont.—The contract for the basement of the R. C. Church, to cost altogether $50,000, has been let to J. H. Gardner for $9,955.

Ottawa, Ont.—A contract has been awarded the John Inglis Co., Toronto, by the Dominion Government for the construction of 13 submarine bell floats at $6,370.

Grand Forks, B.C.—The contract for the erection of the building of the Grand Forks Canning Co. was let recently to Angus McDougall, his tender being $11,000.

Victoria, B.C.—Evans, Coleman .& Evans have secured the contract from the city for 550 tons of steel rails for the light railway to be built in connection with the Sooke waterworks.

New Incorporations

British Manufacturers' Association of Canada, Ltd., incorporated at Ottawa, capital $10,000, to carry on the business of electrical or mechanical engineers, at Montreal.

The Roger Miller & Co., Ltd., incorporated at Ottawa, capital $200,000, to carry on business relative to the construction and erection of public and private works, buildings, etc., at Montreal.

The J. H. Tromanhauser Co., Ltd., incorporated at Ottawa, capital $100,000, to carry on the business of engineers, architects, and builders, at Toronto. Incorporators: John F. Boland, Frederic J. Boland, etc., Toronto.

Morris Construction Co., Ltd., incorporated at Ottawa, capital $100,000, to build public or private works of every kind and description at Ottawa. Incorporators: Kenneth A. Morrison, Thomas A. Burgess, etc., Ottawa.

The Lumsden Lumber Co., Ltd., incorporated at Ottawa, capital $500,000, to carry on the business of saw-mill proprietors, at Ottawa. Incorporators: William White, Leigh M. Farson, etc., Ottawa.

Canadian Specialties Mfg. Co., Ltd., incorporated at Ottawa, capital $1,000,000, to manufacture machinery and apparatus, at Toronto. Incorporators: James S. Lovell, William Bain, etc., Toronto.

Ste. Agathe Lumber and Construction Co., Ltd., incorporated at Ottawa, capital $300,000, to operate saw, shingle, bark and pulp mills and other works for the manufacture of wood and all products of wood.

Temiskaming Automobile & Supplies, Ltd., incorporated at Toronto, capital $40,000, to manufacture and otherwise deal in motor vehicles and boats of all kinds, at Cobalt. Incorporators: Charles J. Frederick Collier, Arthur B. Mortimer, etc., Toronto.

Lake Superior Dry-Dock and Construction Co., Ltd., incorporated at Toronto, capital $1,000,000, to build, erect, construct, steamships, at Sault Ste. Marie. Incorporators: James S. Lovell, Robert Gowans, etc., Toronto.

Winnipeg River Power Co., Ltd., incorporated at Ottawa, capital $1,000,000, to acquire and operate water powers and water privileges and other works for the generation of electricity, at Winnipeg. Incorporators: Ernest Frith, Charles W. Chappell, etc., Winnipeg.

E. G. M. Cape & Co,, Ltd., incorporated at Ottawa, capital $500,000, to carry on the business of general contractors and engineers for the construction, erection, repair or alteration of public works, at Montreal. Incorporators: Lawrence Macfarlane, Charles A. Pope, etc., Montreal.

Tenders

Regina, Sask.—The Regina Plumbing & Heating Co. have offered to instal a heating and ventilating plant in the General Hospital for $42,460.

Ottawa, Ont.—Ten tenders for plans have been received for the proposed new Government-owned elevator to be built at Port Nelson. The tenders have all been sent west to be considered by the Grain Commissioner.

Winnipeg, Man.—Tenders will be received up to December 1st,, 1913, for the supply of D. C. and A. C. Meters, as may be required by the City Light & Power Department, during one year from the date of contract. M. Peterson, secretary, Board of Control Office, Winnipeg.

Ottawa, Ont.—Tenders will be received at the Department of the Interior up to December 1, for the furnishing of 15,000 small and 500 large iron posts for use on the survey of Dominion Lands to be delivered at Edmonton on or before the 31st day of January, 1914. L. Pereira, secretary.

Municipal

Eastview, Ont.—The town council will spend $10,000 on fire engine, station, etc.

West Vancouver, B.C.—The ratepayers have voted $40,000 for a wharf at Dundarave.

Oak Bay, B.C.—The municipal council will purchase water mains for a waterworks system.

Ottawa ratepayers will decide next January whether to continue its publicity bureau or not.

Vancouver, B.C.—Plans are now being prepared for $5,000,000 worth of new civic work for next year.

Sudbury, Ont.—The ratepayers will be asked to vote $8,606 for extension to the power house pumping station.

London, Ont.—The Board of Education have asked the city council to spend $35,000 on a new technical school.

Winnipeg, Man.—The Motor Transit Co. is asking the city for a five-year franchise. A. J. Andrews K.C., represents them.

Woodstock, Ont.—A by-law before the ratepayers on November 6 to lend $12,000 to the Fort Wayne Oil Tank & Pump Co. was carried.

Toronto, Ont.—Plans for widening Yonge St. have been approved by the Civic Works Committee. The work will cost over two millions.

Ingersoll, Ont.—Engineer F. W. Thorold, of Toronto, has submitted to the council plans of a sewage system, the estimated cost of which is $59,000.

Dundas, Ont.—The town council will build a sewage disposal works, and try to obtain a water supply from Lake Ontario in conjunction with Hamilton.

Lennoxville, Que.—The Lennoxville Waterworks Co., through its superintendent, N. H. Greene, has offered to sell the waterworks to the town for $34,000.

Stratford, Ont.—The citizens have voted against the city guaranteeing the bonds of the Avon Hosiery Co., and against purchasing additional fire apparatus.

London, Ont.—The Ontario Railway and Municipal Board has dismissed the application of Swift-Greene, Limited, of London, to lay steam pipes across Carling Street for the purpose of supplying buildings with heat.

Welland, Ont.—The old waterworks plant is being repaired at a cost of $500, and will be used as an auxiliary in the event of a breakdown at the new plant.

London, Ont.—Willis Chipman, of Toronto, and city engineer W. N. Ashplant, last week outlined before the council a program for carrying the $400,000 storm sewer project through.

Medicine Hat, Alta.—The city will submit by-laws authorizing the expenditure of the following sums: $175,000 on a waterworks system; $60,000 on storm sewers; $12,000 on additional fire apparatus; $50,000 for repairs to roads and purchase of road construction plant and machinery; $150,000 for increasing and extending electric light; and $50,000 for drilling gas wells.

Marine

Toronto, Ont.—Polson Iron Works have sent 25 men to Nelson, B.C., to erect the car float built by them for the C.P.R.

Sault Ste. Marie, Ont.—The Company arranging to build a dry dock here, have deposited their $25,000 guarantee. A by-law will be passed later to give the company a bonus of $20,000 a year for 20 years.

Canadian Canal Traffic.—October statistics on Canada's Canals give the traffic total as 39,077,369 tons, which is 4,816,103 tons greater than in the same month of 1912. The increase at the Soo was 3,467,889, the Welland 673,359, and the St. Lawrence 744,835. The figures indicate that much traffic passing through the Canadian Soo reaches the seaboard via American routes.

St. Catharines, Ont.—Final arrangements are being made by Baldry, Yerburgh & Hutchinson, contractors for No. 2 section of the Welland Canal. Mr. Rigby has been in Toronto in this connection.

Refrigeration

Brantford, Ont.—The Brantford Ice Co. have decided to erect an ice manufacturing plant at a cost of about $45,000.

Westmount, Que.—The Centerfreeze Sanitary Ice Co., Merchants Bank Building, Montreal, is contemplating the erection of an artificial ice plant here.

Winnipeg, Man.—Premier Roblin, of Manitoba, says the Government will erect a public abattoir at the new Union Stock Yards here, to encourage live stock industries.

Railways - Bridges

Victoria, B.C.—The C.N.R. will, it is believed, extend its line to Alberni, north of the island.

Owen Sound, Ont.—Mayor Lemon and others have asked Sir Jas. Whitney to aid in building a line between Owen Sound and Meaford.

Halifax, N.S.—The Halifax Tramways Co. has been empowered to issue 6,000 shares of ordinary stock, part of which will be used for extension work.

Sherbrooke, Que.—P. J. Wolfe, Sherbrooke, has the contract for ten miles of extension on the Quebec Central Railway from St. Sabine to St. Pamphile. Mr. Morkill, chief engineer, Sherbrooke.

Galt, Ont.—The terminal facilities of the Lake Erie and Northern Railway at Galt are being made ready. It is expected that the work will be finished this year.

Brantford, Ont.—The rumor is renewed that Mackenzie and Mann, are anxious to get into Brantford. It is alleged that they have made some propositions with reference to the Lake Erie and Northern Railway.

Ottawa, Ont.—The Ontario Lake Front Terminal Railway is applying to Parliament for authority to construct a branch railway from Havelock, on the C.P.R., via Campbellford, to Cobourg and Brighton.

Eastview, Ont.—J. D. Fraser, sec.-treas. of the Ottawa Electric Railway, has informed the council that it cannot extend its lines to Eastview owing to the shortness of the company's franchise.

Ottawa, Ont.—J. D. McArthur, who has the contract for the Hudson Bay Railway from Le Pas to Port Nelson, announces that he has graded over 150 out of 400 miles, and before the season closes, steel will be laid on 130 miles of grade.

Ottawa, Ont.—Pringle and Guthrie, solicitors, give notice of application to Parliament for a charter for the Central Canada Railway Co., with power to conduct and operate a railway from Winnipeg to Edmonton via Yorkton, Sask., and Battleford.

Nelson, B.C.—The City Council and directors of the Street Railway Company have agreed on municipal operation of the line, with the stockholders retaining their interest. To give the city control the number of shares will be increased by 25,000.

Toronto, Ont.—Plans are being prepared for the construction of the Forest Hill Railway in York township, and will be submitted to the Township Council for approval. By the charter, the company is required to spend at least $50,000 within the first year.

Vancouver, B.C.—Sir Richard McBride says he has been assured by Alfred Smithers, head of the G.T.P., that the line from Edmonton to Prince Rupert would be finished by midsummer, next year. He has received similar assurances concerning the C.N.R. from Sir William Mackenzie.

Vancouver, B.C.—It is reported that Sir Richard McBride has concluded a deal with the Standard Oil Co. to give them a charter at the coming session of the Provincial Legislature to build a railway through to Alaska. This line will run in connection with the Chicago, Milwaukee & St. Paul Railway, with headquarters at Seattle, linking the Pacific Great Eastern with Fort George.

Trade Gossip

Miller, Limited, have changed their name to The Dominion Brass Corporation, Ltd.

The name of the **Lyon Gas Saving Co., Ltd.,** has been changed to The Solex Co., Ltd.

The Hudson Bay Co. have issued $5,000,000 new stock for expansion of the store business.

Fort William City Council will engage an electrical inspector, who will have power to appoint assistants.

The Boake Mfg. Co., Ltd., lumber and timber merchants, Toronto, will increase their capital stock from $60,000 to $300,000, and extend their business.

The Preston Car & Coach Co., Ltd., have been authorized to create and convert $100,000 of unissued common capital stock into $100,000 preference stock.

The International Engineering Works, Ltd., of Amherst, N.S., have recently opened three new offices in addition to their regular offices at Montreal, Toronto, etc. These and the representatives are: George M. Taylor, 816 Burrards St., Vancouver, B.C.; J. F. Tracey, 321 Edmonton St., Winnipeg, Man.; and Grodwards Co., Cobalt., Ont.

T. W. Kirby, of the Hamilton Stove and Heater Co., has been elected president of Kir-Benn, Limited, a new stove and furnace Company at Almonte, Ont. William Thoburn, M.P., and J. E. Bennett, Toronto, were elected vice-presidents. Other directors are: T. R. White, A. G. Rosamond, F. W. Robertson, and W. H. Stafford, all of Almonte.

W. W. Butler, vice-president of the Canadian Car and Foundry Company, is interested in the flotation of a new company to be known as the W. W. Butler Co., Ltd. The new company has already taken out papers of organization, and will be capitalized at $100,000. Its business will be to deal in general mill and engineering supplies, car details, power boating accessories, etc. It is stated that Mr. Butler will not resign from the Canadian Car and Foundry Co.

Kilmer, Pullen & Burnham, Toronto, have been awarded a contract by the city of Prince Albert, Sask., for two vertical type generators, 1875 K.V.A. each, 2,200 volts, 3-phase, 60 cycles, 138 r.p.m., and two vertical type exciters, 150 k.w. each, at 300 r.p.m., all made by the Swedish General Electric Co. These are to be used in the power house at LaColle Falls, the development of which has been held up for financial reasons.

J. H. Rodgers and W. J. Spence, foremen in the press room of the E. T. Wright Co., Hamilton ,Ont., have recently invented a tripping device for power presses which prevents repeating, and thereby minimizes the risk of loss of fingers by operators in stamping or press rooms generally. A description of this apparatus appeared in Canadian Machinery some months ago, and we are informed that a patent covering Canada and the United States has now been secured by the joint patentees.

The Garlock Packing Co., Hamilton, Ont., have opened a branch at Calgary, Alta., where a stock of packings will be carried. This branch is under the managership of J. T. Dohm, who is well known in British Columbia and Alberta. L. G. Hargreaves, of the Garlock Western staff, has been appointed Winnipeg branch manager, and W. B. Powell will represent the company in Manitoba and Saskatchewan. The Garlock Co. now have branches in Montreal, Toronto, Winnipeg, and Calgary.

Canadian General Electric Contract.—The town of Aurora, Ont., has decided to instal an equipment of motor driven turbine pumps for protection against fire. It will include two four-stage high lift turbine pumps of Mather & Platt design, built by Canadian Allis-Chalmers, Ltd. Each of these fire pumps will be capable of delivering 400 Imperial gallons per minute, against a total head of 325 feet, when operating at 1,460 r.p.m. They will be direct connected at one end to an alternating current motor, and at the other end to a direct current motor in order to conform with the underwriters' requirements that there must be two distinct sources of power for this purpose. The electrical apparatus, including a four panel switchboard, will be built by the Canadian General Electric Co., Ltd.

Canadian General Electric Contracts.—The new G. T. P. floating dry dock at Prince Rupert, B.C., will be one of the largest and best supplied in the world, and will be electrically operated throughout. The contract for the electrical equipment, which has been awarded by the G. T. P. to the Canadian General Electric Co., Ltd., includes two 200 h.p. and four 100 h.p. variable speed induction motors, with full automatic control, for operating the pumps on the dock. The power will be produced by two 1,250 K.V.A. Curtis steam turbines, with complete condensing apparatus. The exciters for the main turbine-generators will consist of three 35 K.W. turbine driven generators and one motor generator set. The foundry, machine shops, and shipyards will be equipped with motor driven tools, requiring motors ranging from 60 to 10 h.p. The contract for electrical equipment also includes all necessary power and light transformers.

Catalogues

Canadian Steel Foundries, Ltd., Montreal, have favored us with a copy of their Catalogue No. 6, which describes the Jackson railroad switch stand. The special features of this "rigid" stand are clearly set forth, the description being amplified by excellent half-tone cuts.

Bulletin A. 4134 has been issued by the Canadian General Electric Co., Toronto, and deals with apparatus for drying and filtering transformed oil and

There Is No Better Way

¶ Years ago, when "Canadian Machinery" was started on its successful career of service to the mechanical men of Canada, a certain firm signed an advertising order for regular space.

¶ Month after month, year after year, the order ran—"until ordered discontinued."

¶ When "Canadian Machinery" was made a more active medium in February last, this firm was one of the first to contract for half-page space in the weekly issue.

¶ In addition to "Canadian Machinery" other MacLean Publications have been and are being used, and the opinion of the concern we refer to, regarding our publications, may interest and perhaps encourage some manufacturers who are hesitating on the border line of indecision.

¶ This firm—one of the best, if not the best known makers of high-grade machinists' tools in America—recently increased their space to a full page every week.

¶ We quote from their letter dated October 8th, 1913:

> "We are now advertising quite largely in the various publications of your concern. **We appreciate the value of the Canadian Market, and know of no better way of getting after the trade than through your publications.**
>
> "We feel sure you will co-operate with us as advertisers in every legitimate way."

¶ Here is a case where an American manufacturing firm looking to Canada for only a very small percentage of their total business, considers it policy to increase their space in "Canadian Machinery"—and this after years of experience in this journal.

¶ Their judgment, born of experience, ought to be pretty convincing to any manufacturer seeking to market his product among the machinery, foundry and general metal-working industries of Canada.

Rate Card and full information gladly furnished.

Save Your Time ! !

Time is the business man's most important asset, and to get the most out of a given amount of time his problem.

The many demands made upon his time makes it difficult for him to keep posted upon momentous questions and national happenings. This raises another problem—

What shall the business man read?

Of magazines there are no end,—fiction magazines, technical magazines, professional magazines, each elbowing its way to the reader's notice. Very entertaining or instructive or educative the respective classes may be, but the magazine that combines all of these qualities, that fills the requirements of a broad, high-class, periodical for the business man's library, is unique. Canada has such a publication in MacLean's Magazine.

It differs entirely from any other Magazine. Technically it should not be called a Magazine. It is a high-grade national monthly newspaper. It aims to publish the latest information from the pens of the best available writers of the Political, Social and Business development in Canada and throughout the world. It is just what is needed to fit with the business man's hobbies and keep bright the culture of his information.

The fiction also from the strongest Canadian writers is so select that the busy man can afford the time he thus spends fascinated by the lure of romance and adventure. Lastly, such a budget of literature meets the demand of the business man's home in that it is an educative, sterling, broad-minded oracle for the family circle.

Secure a copy from your nearest newsdealer. You'll enjoy its pages from cover to cover. Take a copy home to-day—The price is twenty cents.

for drying transformers. The principle of operation and detailed description of the apparatus is given together with illustrations of the various types and tables of capacities, etc. A high potential oil testing outfit and aluminum lighting arresters are also dealt with in the bulletin.

"**Treatment of Boiler Feed Water**" is the title of a neat booklet issued by the Dearborn Chemical Co., of Canada, C.P.R. Building, Toronto, Ont. Attention is drawn in this publication to the fact that water used as steam boiler feed may and does contain a variety of substances in varying qualities, and that, therefore, proper remedial agents to deal with the individual constituents are necessary, together with the choice of reagents to prevent the formation of equally deleterious substances to those originally existent. The Dearborn methods of, and preparations for, treating water for boiler feed are explained and discussed, from which it will be noted that a combined theoretical and practical application of chemistry together with an intimate investigation of plant operating conditions, is the basis from which Dearborn treatment is successfully effected.

The International Engineering Works, Ltd., manufacturers of Robb engines and boilers, has just published a new bulletin entitled, "Robb Scotch Boilers." This boiler is a modification of the well-known standard Scotch marine boiler. The changes from the standard design are for the purpose of overcoming that great objection to the marine boiler, poor circulation. In the Robb type, the steam and water drum, which is above the shell is connected thereto by short necks, and a circular plate or baffle is so arranged beneath the front neck as to compel all the water to flow around the inside of the shell to the bottom, from which it rises amongst the furnaces and tubes to the steam drum. Other advantages of this boiler are described in the bulletin, which gives full particulars as to an economy test run at Bush & Terry's power plant, Philadelphia. In this test, the 200 h.p. boiler took care of a widely fluctuating load showing an average combined efficiency of 73 per cent., working under the variable conditions up to 50 per cent. overload. In the same bulletin we also find a circulation test conducted to determine whether or not the claims for good circulation would be substantiated. The method of conducting this test by inserting thermometers at various points is fully explained. The International Engineering Works, Ltd., with sales offices at Toronto, Montreal, Edmonton, Winni-

LAFFITTE

WELDING PLATES

A SCIENTIFIC CHEMICAL WELDING COMPOUND. WELDS IRON AND STEEL AT A REMARKABLY LOW HEAT.

You are not taking our products seriously enough; unless your blacksmith asks for it you never give it a thought. We can easily reach the smaller man who must consider every economy, but we cannot get at the man in your shop.

The larger you are the more you need LAFFITTE.

Let us send you samples. There are endless economies you can effect, and the cost is insignificant compared with the results.

Laboratory Manual of Testing Materials, by W. K. Hatt, C.E., and H. H. Scofield, M.E., 127 pages 7½ x 4¾, published by the McGraw-Hill Book Co., New York. Price $2.00 net. This book has been gotten out for the benefit of engineering students for use in the material testing laboratory, one purpose being to relieve the instructors of the necessity of explaining the details of mechanical procedure, and so give them more time to devote to matters of greater educational importance. The material for this manual was compiled by the authors from operations conducted at the laboratory of testing materials at Purdue University, extending over a number of years. Originally the book was published by Professor Hatt, but this is the first edition in the present form. The first part of the book is devoted to general instructions for making tests, etc., definitions of terms, formulae, and symbols used in the laboratory. One chapter deals with testing machines and their method of operation, with a description of apparatus used in conjunction, when making tests. More than half the book is devoted to instructions for performing experiments on various materials, such as steel, concrete, wood, etc. These are sufficiently comprehensive to enable the student to do a considerable amount of work, without the constant supervision of the instructor. A condition which will be of material benefit to both instructor and student. The appendices at the end of the book contain tables covering the mechanical properties of various materials and a standard specification for cement.

The subject is dealt with in a practical manner, devoid of any complicated calculations, the formulae given being more or less elementary. The book contains a number of illustrations and diagrams which are generally, well arranged.

The First Law
of nature is self-preservation. To save yourself is natural. But why need you have conditions in your plant to warrant the carrying out of this law. One of the worst danger factors you have to deal with is the projecting set screw. Why not safetify your factory by using

Allen Safety Set Screws
throughout. A small article but a great big trouble saver.

Your dealer carries them, so the next time his salesman calls just say ALLEN to him, and see how he "comes back." Send for circular!

Geometric Screw-Cutting Die Heads Lead

They are in general use on Screw Machines and Turret Lathes.

Employed in cutting right and left-hand threads of standard or special pitch; also various special forms, such as the Acme, Metric, etc., as well as standard pipe threads.

The chasers are opened automatically, and there is no running back over the work after the thread is cut.

Geometric Die Heads

Can be furnished for cutting any size thread from the smallest screw up to the greatest diameter required.

Tell us your requirements, and we will recommend the Die Head.

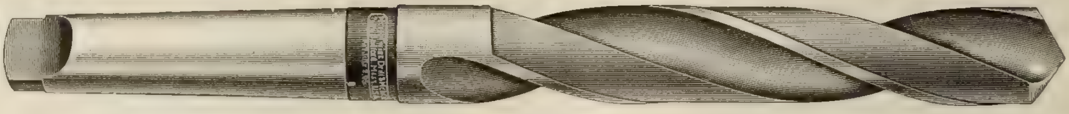
USE "MORSE" TOOLS



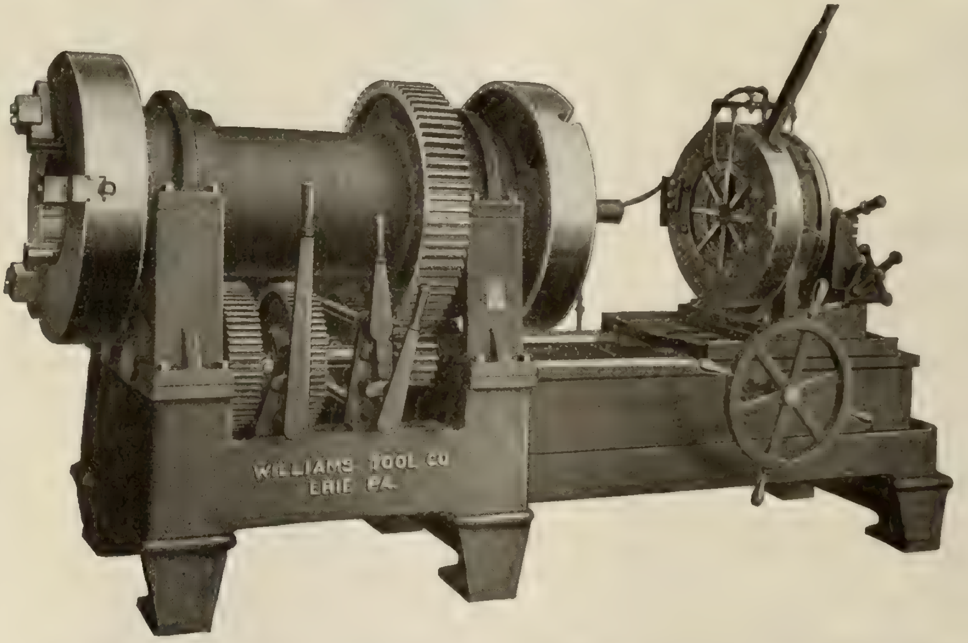
We have been manufacturing Drills and several other lines for nearly half a century and if we had not made good for our customers we would have been out of business long ago. The demand for "MORSE" products increases rapidly as the years go by. They are—

Twist Drills, Reamers, Milling Cutters, Taps, Dies, Screw Plates, Arbors, Chucks, Mandrels, Sleeves, Sockets, Counterbores, Countersinks, Gauges, Mills, Taper Pins, Wrenches and Machinery.

It is a good plan to have a "MORSE" catalog on your desk for reference. May we send you one?

Morse Twist Drill and Machine Co.
New Bedford, Mass., U. S. A.

"Morse" Drills and Tools are handled by:—Rice Lewis & Sons, Limited, Toronto; Aikenhead Hardware, Limited, Toronto; Frothingham & Workman, Montreal; Mechanics Supply Co., Quebec.



The gas light was a big improvement over the tallow dip, but it had to give way to the electric light; and the Tungsten has superseded the little glimmer that once delighted us.

If you are still employing pipe cutting methods as antiquated as the tallow dip, you need a Williams' Pipe Machine, which occupies the same position in the pipe cutting field as the Tungsten does in the lighting world, to bring you up-to-date.

Let us quote you prices and terms: any machine to cut 10 *sizes of pipe between* 1-4 *inch; and* 18 *inch; with any kind of power.*

Anyone making, selling or buying a pipe machine, claimed to be a Canadian-made Williams' Pipe Machine does so without right or authority from us and is liable to prosecution for damages.

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

Ask for Catalog No. 36-C.

The CLEVELAND Twist Drill Co.

New York CLEVELAND, OHIO Chicago

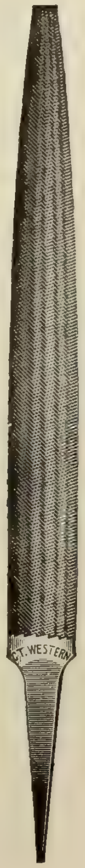
Issue "Nicholson-made" Files

THESE brands of files sell over 200,000 a day —unique and alone in bulk of trade.

If your factory issues a Nicholson brand as your shop file, your workmen are insured almost unvarying high-quality filing. The action and "feel" are constant and unchanged from lot to lot of Nicholson-made files. Each file that reaches you is hand-tested.

Besides that, special steels, special machines, and special hardening methods exclusively Nicholson, give the greatest file value your money can buy. At all jobbers.

Nicholson-made Brands: American, Arcade, Eagle, Globe, Kearney & Foot.



NICHOLSON File Company

27

PORT HOPE CANADA

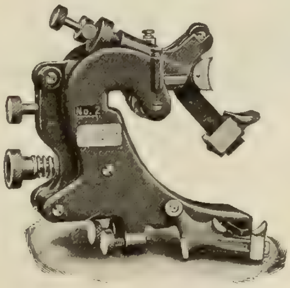
What Does Commercial Grinding Mean?

It Means Rapid Production

which can be obtained only when the work is supported firmly so that heavy cuts can be taken rapidly without impairing the accuracy.

It Means Accuracy With Minimum Attention

from operator. This is possible when the machine is fitted with automatic devices for bringing the work to accurate size. Both of these requirements are fulfilled on B. & S. Grinding Machines by our **Universal Back Rests and Automatic Cross Feed.**



UNIVERSAL BACK REST

That is why our machines are so successful in continuous commercial work.

Tell us your range of work and we will send a descriptive circular of a machine that will fill the requirements.

For Your Business' Sake

READ

THE FINANCIAL POST!

Recently one of the largest wholesale houses in Canada — a firm who are unusually strong financially—read the "Business Outlook" article in The Financial Post. They not only immediately sent their subscriptions for a year, but asked The Post to send them 100 copies for distribution among a few of the leading retail houses with whom they do business.

A year ago, when leading financiers stated openly and publicly that Canada was on the threshold of two years of the greatest prosperity in its history, The Financial Post, in its weekly article on the business outlook, expressed a difference of opinion from this view and urged caution. It frankly told its readers that the money situation looked doubtful, and said that until conditions improved, wholesale merchants, manufacturers, retailers and business men generally should not embark on new developments unless they had ample capital of their own without borrowing from the banks, and then, only when it was absolutely necessary. By new developments The Post meant extensions of buildings or stores. At the same time The Post advised that the strictest attention be paid to collections; urging insistence upon the general public paying up everything it owed. The readers who acted on The Post's advice are in a much better position in every way than those who were not readers and who acted otherwise.

The Financial Post of Canada has excellent sources of information on financial, business and crop conditions, not only in Canada, but in United States and in the financial centres of Europe. As a matter of fact, one of the earliest hints last year of coming financial stringency came direct to The Post from one of the largest financiers in Europe, and came to The Post before it came even to the leading Canadian bankers.

In consideration of these facts, no business man in Canada can afford to be without The Financial Post. Simply initial the attached coupon and pass to your cashier for attention.

Information Wanted!

¶ There may be some eminently successful and well known firms who have never advertised.

¶ But who are they?

¶ Any information leading to the identification of such a concern will be gratefully, if unexpectedly, received.

¶ Our object in seeking such information is a worthy one, because no matter how prosperous and popular a non-advertising firm may be, we can offer a plan that will make them still more successful and favorably known.

¶ We can think of several concerns who do not advertise, but they are not noticeably prosperous, nor are their names in the machinery hall of fame.

¶ Neither are their names in Canadian Machinery's Buyers' Directory, which is a very respectable hall of fame in itself.

¶ Take your time and think it over.

¶ It will take time and it is worth the thought.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

A Valuable New Book on an Important Trade

PATTERN-MAKING

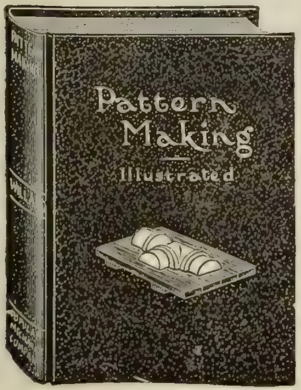
By G. H. WILLARD

Two Significant Opinions:

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co, Wilmington, Delaware.

224 Pages. 312 Illustrations. Cloth Cover.



With Additional Chapters on Core-Making and Molding

"WRITTEN SO YOU CAN UNDERSTAND IT."

A book for the man who does the work. Written by a practical patternmaker of many years' experience. Gets right down to business in the first chapter and keeps it up throughout the book. Full of kinks and actual working information. Profusely illustrated.

Chapter Headings

I. Pattern-Making as a Trade. II. The Tools. III. Woods. IV. Joints. V. Turning. VI. Turning (Continued). VII. Turning (Continued). VIII. Turning (Concluded). IX. The Circular Saw. X. The Circular Saw (Continued). XI. Machine Tools. XII. Machine Tools (Continued). XIII. Simple Patterns. XIV. Simple Patterns (Continued). XV. Simple Patterns (Concluded). XVI. Crooked Patterns. XVII. Large Pattern Work. XVIII. Large Pattern Work (Continued). XIX. Crosshead Guide Patterns. XX. Sweep Work. XXI. Pipe Work. XXII. Stove Pattern Work. XXIII. Molding—Machine Work. XXIV. Molding Pattern Work.

Part II.—Core-Making and Molding.

Chapter I. Core-Making, Simple and Complex. II. Principles in Molding. III. Loam Patterns and Loam Molds. Everyone following this trade, or intending to learn it, should have a copy of this valuable book.

Price $1.10 Postpaid

THE MISSING LETTER

You know the beautiful, blue, smooth surface of a Casting is one of its essential qualities.

You know its appearance acts as a silent salesman for that same casting.

You know, also, that the cost is less when the Foundry produces this effect without the aid of the Scratch-room or the Chipping gang.

You, perhaps, know it is possible to procure a Plumbago-Ceylon Lead—that will produce that effect.

Perhaps in the mazes of substitutes sailing under a similar name you have forgotten that I import from Ceylon's Coral Strand just that kind.

Its cost is less—at the end.

The same high standard of excellence pervades, with pocket-book popularity, my entire line of Foundry Facings and Foundry Supplies.

If your letter of inquiry is not missing in my mail, I will tell you more about it.

FREDERIC B. STEVENS

MANUFACTURER

STEEL CASTINGS

Of the Highest Prevalent Quality

We make perfect castings at a price that is right.
NEW PROCESS CONVERTER STEEL CASTINGS, annealed and unannealed.

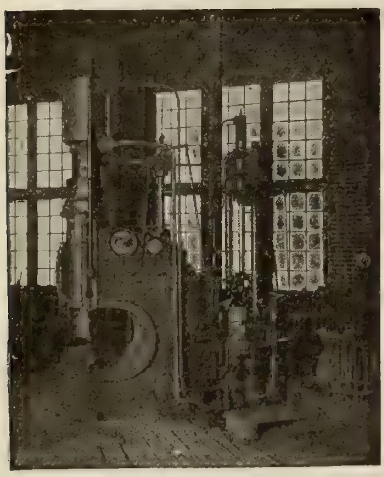
We also make **CHROME-MANGANESE AND NICKEL STEEL CASTINGS.**

Any size from quarter lb. to 30,000 lbs., absolutely guaranteed.

GET OUR ESTIMATES

JOLIETTE STEEL CASTING WORKS, Ltd.
Head Office and Foundry: *JOLIETTE, P.Q.*

Casting for a 10,500 H.P. Water Wheel



High-Speed Steam-Hydraulic Forging Presses

Double your production with one-half your labor cost and steam consumption. Cost of repairs reduced. Eliminates heavy shocks and vibration.

"SINGLE LEVER CONTROL"

Small sizes—single-frame type. Large sizes—four-column type.
Built for doing all classes of forging, shearing or pressing

100 Tons to 12,000 Tons Capacity

VOLLANS

Butt Welder

Spot Welder

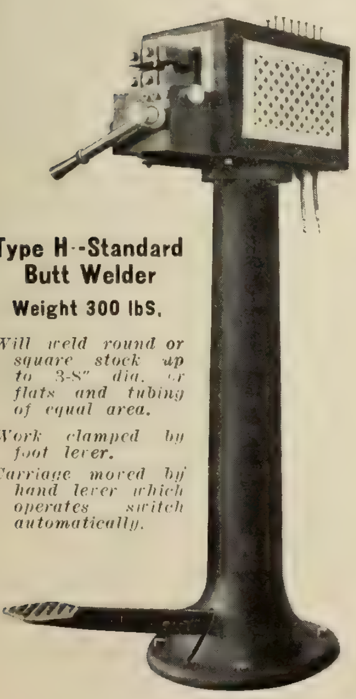
VOLLANS
Electric Welders

represent the highest standard of excellence yet achieved in electric welders. Their use means the increasing of production with the decreasing of cost. **They embody features not found in any other type or make of electric welders,** giving maximum efficiency in results, and making welds that are perfect and their production rapid, at a very small expense.

It will pay you to investigate these welders as such investigation will demonstrate to you, beyond all doubt, that the welders are in a class by themselves, considered from efficient and economical standpoints. This includes all riveting operations and butt welding of all descriptions.

Prompt attention given to inquiries and correspondence, either in person or by mail. Send us samples of your work to be welded. We will do the welding and return them for your investigation, with valuable data which will convince you of the correctness of every claim we make.

Our Engineer is at your service at all times to show you how to save dollars.



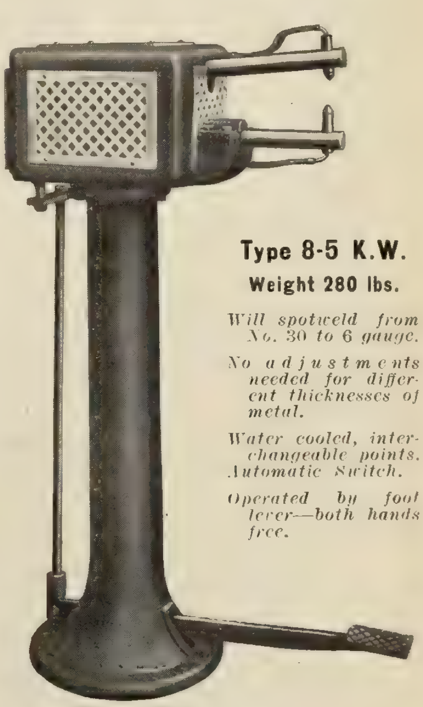
Type H--Standard Butt Welder

Weight 300 lbS.

Will weld round or square stock up to 3-8" dia. or flats and tubing of equal area.

Work clamped by foot lever.

Carriage moved by hand lever which operates switch automatically.



Type 8-5 K.W.

Weight 280 lbs.

Will spotweld from No. 30 to 6 gauge.

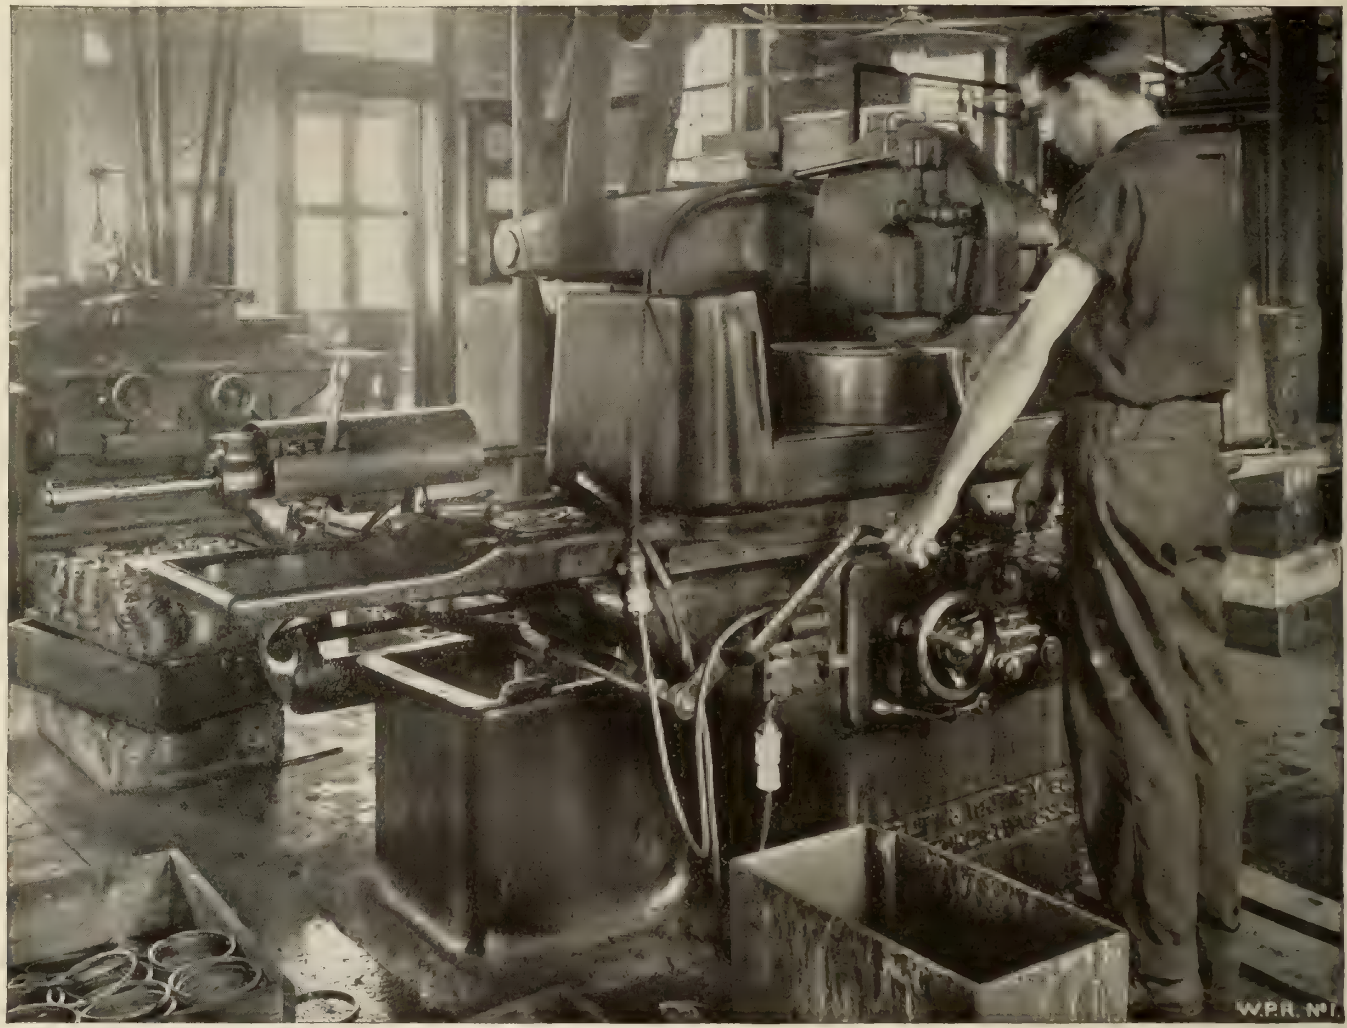
No adjustments needed for different thicknesses of metal.

Water cooled, interchangeable points. Automatic Switch.

Operated by foot lever—both hands free.

Fisher Motor Co., Limited
Walkerville, Ont.

This Man Grinds 70 to 80 8-inch Piston Rings Per Hour



Pratt & Whitney New Disc Grinder

Primarily designed for circular work where surfaces to be ground are at different heights. Also adapted for work where it is preferable to have finish lines circumferential instead of radial.

Wheel Mounted in an Arm.

The machine is provided with a large, correctly supported and powerfully driven wheel mounted in an arm at right angles to work. The arm has a perfect fit on an arbor which is substantially supported on an upright. The wheel is provided with both hand and automatic vertical feeds.

The bed, table and table feed mechanism are similar to the well-known P. & W. 14-inch Vertical Surface Grinder.

Very Efficient on Piston Rings and Thin Hardened Discs.

For grinding piston rings the P. & W. Disc Grinder cannot be surpassed. An accurate even thickness and a smooth finish are quickly obtained. The large diameter grinding wheel will stand up for a long time without perceptible wear.

This machine has also proven very efficient on thin hardened discs, as there is comparatively little heat generated during the grinding operation. This permits the work to be ground without danger of warping.

Write for "Progress Reporter" No. 24, which fully describes this grinder as well as several other new machines.

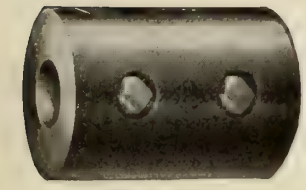
SHAFTING COUPLINGS

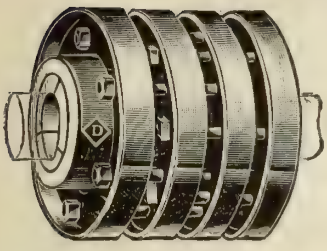


Solid Sleeve

DODGE SOLID SLEEVE

A low-priced coupling designed for light shafting, has countersunk set screws, and is finished over entire surface.

Single Compression



Double Compression

DODGE KEYLESS COMPRESSION

Built on the most liberal lines and calculated to furnish the manufacturing and supply trade with a coupling that can be had immediately from stock, and may be depended upon at all times to couple shafting without keyseating or keys, thus affording ease and despatch in erecting at a minimum cost. Made in two styles, Single and Double Compression. For shafting up to 2 7-16 inch diameter, we recommend the single compression coupling for ordinary duty. For larger shafting, we recommend the double compression coupling.

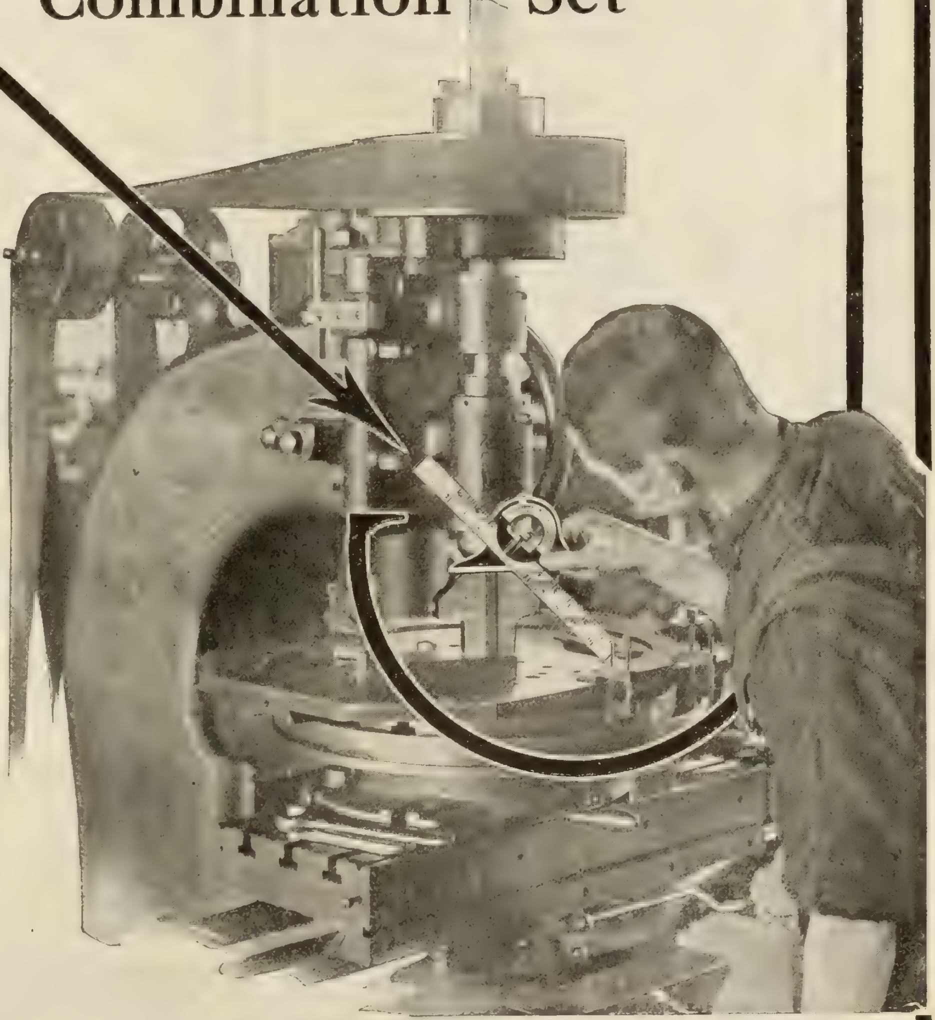
One Efficient Instrument

Replaces Seven Ordinary Tools

Too good to be true? Not at all. It is a fact. This machinist is testing his work, using the Combination Set as a protractor. But he can slip on a centre head or a square and use the instrument to centre round work or as a try-square or bevel then he can use the rule separately. In short this tool does the work usually requiring a rule, square, level, protractor, bevel, centre head, and depth gage. It does not sacrifice the accuracy of the individual tools to obtain this convenience. And think of the room it will save in the tool box.

STARRETT

Combination Set



No machinist's outfit is complete without this Starrett Combination Set, but do not stop when you have the Combination Set. There are lots of other time-saving tools in the Starrett line. The Starrett Quick Adjusting Micrometer may be just what you are looking for to save time in making frequent micrometer measurements. Other tools will accomplish as good results in their line as the Combination Set does in its field.

Let us send you our free catalog 203 which describes the full line of Starrett tools. Write now.

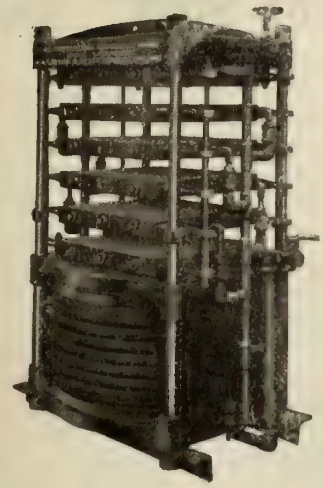
Cut Your Press Expense in Two!



75-ton Press for Vulcanizing.

Here is a Press whose initial cost is less than half that of a Ram Press plant of equal capacity—whose running expense is negligible—whose upkeep cost is nil. This is because it is the simplest possible application of hydraulic pressure—the

Pistonless
Hydraulic Press

Heavy, expensive foundations, motive power, pump, piston, packings, leakage, expert attention—all are eliminated. The water from any tap, under ordinary service pressure, multiplies this pressure in an armoured collapsible cylinder, the head of which forms the platen of the Press. Nothing could be simpler or more effective.

The Pistonless Press is made in sizes and types suitable for Baling, Extracting, Vulcanizing, Printing, Bookbinding, Electrotyping, or any other application of heavy pressure. Write for full information, stating the purpose for which you require a press, to

WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 15—Universal Milling Attachment

Few shops do not, at some time or other, run up against work that baffles the ingenuity of their best mechanics, and the universal milling attachment was designed for just such cases.

The Universal Milling Attachment for Milwaukee Millers differs from others in that it is unusually rigid and heavy. This construction adapts it to more than very light work and enables it to withstand severe and constant usage. Not only is it suited to meet the unusual and occasional job but it may also be used to advantage on day-to-day work.

There are two circular bases, one imposed upon the other, the planes of which are at right angles to each other. Both bases can be revolved through 360 degrees, thus making the spindle which is carried on the second swivel piece, completely universal in its movements. There is no conceivable angle in a globe at which it cannot be set.

Because the distance from the center of the spindle to the bottom of the casting that carries it, is short, this attachment can be used for rack cutting. When used in connection with spiral Universal Dividing Centers, it can also be used on Plain Millers for milling spirals at any angle. This is illustrated in cut No. 4 below where the attachment is milling a steep angle spiral gear that could not be reached on an ordinary Universal Milling Machine on account of the angle being greater than could be obtained by swiveling the table.

These "WHYS" on various attachments for Milwaukee Millers are very important when considered in connection with the unique features and excellent construction of our machines. Write for Bulletins and get complete facts.

At the Tomb of Yesterday's Opinions

¶ The first ship that crossed the ocean propelled by steam carried as a part of its cargo several hundred volumes of a book written by a "learned scholar," "proving" the physical impossibility of navigation by steam power.

¶ When Peter Cooper, the great inventor, raced his first locomotive with a stage-coach drawn by two white horses and was defeated, people who feared that the locomotive would mean the passing of the horse returned home again to the quiet of the farm and the peace of agricultural pursuits.—Thus does the world move.

¶ We stand at a new point in time—the dawn of a New Age of Thought is flushing the sky. Man has solved the riddle of the Universe; it is Energy. There is nothing in the Universe but this one mysterious substance and life itself is nothing more than transformed sunlight.

¶ Man has solved the riddle of Energy because he has found a way to harness and apply it. Since Ben Franklin sent his kite into the sky and made peace with the lightning's flash, the world has moved forward at a pace which even those who have played the biggest part in this advancement really do not comprehend.

¶ While a certain contingent of the "old school," which insists on running a flower garden in winter and cutting ice in summer, sits about idly on boxes talking of the folly of the airship and, how, "if it had been intended that man should fly he would have been provided with a pair of wings,"—an aviator sails down over New York City from St. Louis, circles the Singer Building a few times, across the Hudson—and out of sight against the eastern sky.

¶ We stand at the tomb of the old way of doing things—the world is beautified in degree as we make it so. The thing we elect to do reflects the spirit of the man who plays the game. The spirit of the man who conducts a business is seen in every advertisement, in every sale, in every display of merchandise, and most of all, in the class of customers that patronizes his place of business.

¶ "Power gravitates to the man who knows how."—Customers rally to the store that offers the finest service in conjunction with the most dependable merchandise. The old, ossified notion that a shop was a place for the rat and the cobweb to make merry has been given an appropriate burial.

¶ To-day, the shop, the store, the plant, the factory—is a place where men do useful work; and to do useful work is the greatest happiness—and the greatest happiness is the greatest good.

¶ Nothing goes in business any more but honesty, integrity and materialized truth. The drunken poet who rhymed verses and reveled in wine has been succeeded by the man who builds temples to truth and beauty, who paves streets, lights cities, builds parks, constructs bridges, plants flowers and gardens and gives employment to the sons and daughters of men.

¶ Old methods of doing things in every craft, profession and business have been discarded and we have evolved more practical, efficient and beautiful ways. The part each of us plays in this drama is recorded for or against us here and now. You are becoming a master in your line or else you are on the high-road to the oblivion of mediocrity.

Efficiency

INDUSTRIAL NOTABILITIES--No. 9

CHARLES SEWARD WILCOX

YEARS ago, when Hamilton had less smoke and ambition, two young men set out into the neighboring forests to shoot fowl. They went in a rig, but, losing one another when the day was well advanced, one hired another outfit from a farm. The other, supposing that his companion would follow somehow, returned home. On the way he was compelled to travel at a fearfully slow pace because some one ahead of him filled the whole roadway. His speed was thus reduced to that of the other, which was a leisurely jog. Hard and long he shouted and swore, but without effect. Like the old farmer of to-day, the man in the first vehicle seemed to say, "Toot and be damned." When they emerged on to the highway, it was discovered that the driver of rig No. 1 was his fellow-sport, and no less a person than Charles S. Wilcox, now president of the Steel Company of Canada.

When the Steel Company holds its annual meeting nowadays the president still jogs along in the first rig. He does not prevent others from progressing, but they may shout themselves hoarse without producing as much as a syllable from him. He is described by one who knows him as a most unassuming, approachable, quiet man, who requires to be drawn out. Unlike many heads of steel plants, he knows the business, and often when visiting the Steel Company's various plants, he will draw attention to mechanical defects.

In ten years he jumped from the position of clerk in the Ontario Rolling Mills at Hamilton into the chair of the general manager. There was nothing very remarkable in this, since his father owned the rolling mills. After receiving an elementary education in his native town, he took a scientific course at Yale University, graduating in 1879 with the degree of Ph.B. Then he came to Hamilton, and in 1880 had become a director in and secretary of the Ontario Rolling Mills. In 1890 he was appointed general manager.

CHARLES SEWARD WILCOX.

When the merger of the Ontario Rolling Mill took place, in 1899, into the Hamilton Steel and Iron Company, he was chosen as General Manager, and afterwards became President of the Corporation. In 1910 the Steel Co. of Canada, Ltd., was organized, consisting of the Hamilton Steel & Iron Co., the Canada Screw Co. of Hamilton, the Canada Bolt & Nut Co., the Montreal Rolling Mills Co. of Montreal, and the Dominion Wire Manufacturing Co. of Montreal, and Mr. Wilcox was elected President of the merged companies, now known as the Steel Co. of Canada, Ltd., with headquarters at Hamilton, Ont. He is also identified with the Sawyer-Massey Co., Ltd., of which he is a director and Vice-President, also a director of the Traders Bank of Canada. He is a member of the Hamilton Club, the Thistle Club, the Hamilton Golf Club, and the Royal Hamilton Yacht Club.

It is fifty-seven years since the Steel Company's President stole into the world. He came by way of Painesville, Ohio, his parents, Aaron and Jane Wilcox, both being of English descent. Thirty-four years ago he came to Canada, and people began to regard him as a confirmed bachelor. Six years ago he stole another march by marrying Margaret Morley, of Cleveland, Ohio. They have one daughter, and they live in Hamilton.

Considerations Relative to Gears for Machine Tool Drives*

By John Parker

This paper deals with the important subject of selecting the proper material for gears in accordance with the best modern machine-tool practice. The method of heat treating and hardening gears is fully explained, and the proper hardness by the scleroscope test for the different stages is given.

THE basis of this paper is the consideration of the following six questions relating to the use of gears for driving machine tools:

1—Under what conditions is it advisable to use cast-iron or steel gears for machine-tool drives?

2—Are the objections to cast-iron on the ground of wear or breakage?

3—What tooth pressure is safe for cast-iron gears?

4—What grades of steel gives best results and how should they be treated?

5—How hard is it advisable to make steel gears before machining them?

6—Are they to be hardened after machining, and if so, to what scleroscope test?

Cast Iron Gears.

There are a number of well established gear conditions that are common to the majority of machine tools, which if noted may prove somewhat of a guide in selecting the proper material for the gears, considered from the standpoints of economy, efficiency, and durability. The conditions may be classified, as in the accompanying table.

The objections to cast iron cover both wear and breakage. If the speed is excessive, say about 500 ft. per minute, they are likely to wear quite rapidly; and on slow speeds and heavy pressure, breakage will occur, unless they can be made of adequate size, as in the case (E), where the back gears are so located in the machine that it is possible to employ large diameters, coarse pitches and wide faces.

The question of tooth pressures in cast-iron gears is somewhat problematical. The Brown & Sharpe Mfg. Co. have in successful operation a gear in the spindle drive of their largest milling machine made from a hard, close-grained cast iron having a tensile strength of 23,000 lb. per sq. in., which when running at the slowest speed sustains a pressure on the teeth of 8,250 lb. It is calculated that two teeth are always in contact, which gives 4,125 lb. pressure per tooth. The area in cross-section of each tooth is 1¼ sq. in., equaling 3,300 lb. per sq. in.; when the gear runs at the fastest speed the pressure is about 1,000 lb. per sq. in. It is not known whether the pressure could be increased to any considerable extent, but it has been overloaded to at least 30 per cent. without injury; this was when testing out the machine, and the overload was of short duration. It might be said that this gear is not subjected to any sudden shock; if it were, the allowable tooth pressure would be considerably less.

Steel Gears.

For gears that are of small proportions and yet are subjected to heavy duty, it has been found that in cases where the more common steels have failed, excellent results have been obtained from using a 5 per cent nickel steel. This steel casehardens with a very hard surface and still has a strong and tough core, making it an ideal steel to use where the pressure is heavy or the gear is subjected to shock. Experience shows that drop forgings are more uniform in texture than bar stock. This grade of

Gear Conditions Common in Machine Tools.

(A)—Gears always in mesh, the wear on the teeth being constant.	(a)—Slow speeds, light duty	Cast iron.
	(b)—Slow speeds, heavy duty	Machinery steel.
	(c)—Fast speeds, light duty	Machinery steel.
	(d)—Fast speeds, heavy duty.	Machinery steel, casehardened.
(B)—Gears in sets that are removable and interchangeable with each other, distributing the wear over a number of gears.	These are change gears used in thread cutting on lathes, spiral cutting on milling machines, indexing on automatic gear cutters and feed and speed change gears; speeds and pressures are generally moderate.	Cast iron, excepting the smallest, which may require to be of steel.
(C)—Gears in sets that are non-removable and partially interchangeable, distributing the wear over a number of gears. Changes made while gears are in motion[1]	Used as quick-change feed gears — changes made by levers; high speeds and heavy pressure.	Machinery steel, casehardened.
(D)—Gears in sets that are non-removable and partially interchangeable, distributing the wear over a number of gears. Changes made when gears are at rest[2]	Used as quick-change feed gears — changes made by levers; high speeds and heavy pressure.	Machinery steel, casehardened.
(E)—Gears that are employed only part of the time the machine is working, and are engaged and disengaged when the machine is stopped.	This condition applies to back gears for the spindle drive. Gears are made large diameter, coarse pitch and wide face; speeds moderate and heavy pressure.	Hard, close-grained cast iron.

(1) If the changes were made when the machine was at rest, the gears would not require hardening. But custom demands that changes be made while the machine is running.

(2) Although the changes are supposed to be made when gears are at rest, careless workmen will violate this rule, with the possibility of breaking the engaging gears. Some makers use an alloy steel in their spindle train to prevent breakage, but a better way is to provide means whereby it is necessary to stop the machine before throwing in the gears. This applies to the tumbler type of change gearing.

---

*Paper read recently before the American Society of Mechanical Engineers.

steel is given an oil treatment, and is also annealed before machining. The oil treatment is as follows: Heat to 1,550 deg. Fah., and quench in oil. To anneal, reheat to 1,350 deg. Fah., and cool very slowly. It is then ready to machine. After machining, it is carbonized as follows:

Pack in any good carbonizing material and cover very carefully to exclude air, place in furnace and heat to 1,700 deg. Fah., and hold long enough to get the desired depth of casing. Care should be taken to have it heated entirely through. Ordinarily three to four hours will suffice for this process. Then take out of furnace and cool off in the boxes; remove from the boxes and place in furnace or bath; reheat to 1,550 deg. Fah. and quench in oil. Again reheat to about 1,380 deg. Fah. and quench in oil or water according to the size and shape of gear. If the gear is of generous dimensions and free from sharp corners, water is preferably used. Small slender gears are quenched in oil, on account of the liability of cracking if water be used. For ordinary gears, the scleroscope test should show 80 to 85 points of hardness. If the gears are used as clash gears they should be drawn to 475 deg. Fah., or about 70 to 75 points of hardness, by scleroscope test, to avoid chipping.

The various kinds of steels used for gears are of such a nature that they do not call for treating before machining, but where extra toughness in shafts is required to withstand torsion and bending strains, 3½ per cent. nickel steel is very satisfactory. This grade of steel is rough machined, then heat treated, as follows: Place in open furnace or bath, heat to 1,500 deg. Fah., and quench in oil. It is advisable to experiment with a small quantity in each batch before subjecting a whole lot to the drawing out heat, which should commence at about 700 deg. Fah. If the scleroscope registers between 50 and 58, the correct hardness has been obtained; if higher than 58, the parts should be reheated to a higher temperature than before; if lower than 50, the parts must be rehardened. After this treatment, the pieces are finish machined. No further hardening is necessary. When machining slow speeds and feeds must be used.

Practically all alloy steels and all low-carbons steels are hardened after machining and finished by grinding after hardening. About 0.010 in. on the diameter is left for this operation. All gears should run true, and to obtain this result not only are the holes ground true with the pitch circle, but the hubs are ground on their faces so they will set square with their shafts when tightened up by nuts. The scleroscope test for 30 to 35 point carbon machinery steel is anywhere from 80 to 90, and for 5 per cent. nickel steel for ordinary gears 80 to 85, and for clash gears 70 to 75. All steels are tested by the file in addition to the scleroscope. The file test by an expert is very reliable, and some feel that possibly more confidence can be placed on his judgment than on any testing instrument.

The above notes apply to spur and bevel gears. For worm and worm-wheel drives, the worm should be made of machinery steel, casehardened, and the wheel of a hard bronze. Both should run in a bath of oil, especially if under high speed and heavy duty. Spiral gears should be used only where the duty is light. The material should be the same as for a worm and wheel, and they should also run in oil to avoid cutting.

For index mechanisms, where accuracy is essential, if the worm is hardened the thread must be ground afterwards. This is done in all the spiral heads of Brown & Sharpe make. Generally, the worm, made of tool steel, is left soft. Worm wheels for indexing purposes only are usually made of cast iron, and, invariably, if of larger diameter. High-multiple threaded worms for indexing mechanisms should not be used; a double thread can be tolerated, but not more, if accurate indexings are required.

◆

STEEL VS. CAST IRON PIPE.

EVIDENCE of local failure of cast iron or steel pipe is of little value in comparing the advantages of the two metals for water or gas pipe lines, unless one has evidence of the behaviour of both under similar conditions, as the conditions vary greatly with the nature of the soil in which the pipes are buried as well as with the analysis of the water or gas passing through the pipes. Cast iron pipes naturally have the advantage of being under ground longer than steel pipes, which have come into common use only during the last 20 to 30 years. The results which have been obtained up to date with steel pipes are so satisfactory that there is no reason why steel mains should not have a life as long as, if not longer than, that of cast iron pipes.

One of the first instances of the adoption of a steel main was for the water supply of Melbourne, Australia, more than 30 years ago, and the example of Melbourne has been followed by all the leading centres of population in Australasia, particularly during recent years, after an experience of 20 years or more in Melbourne which demonstrated the reliability and freedom from corrosion of the steel pipes.

Steel Pipe Coating.

The main feature to which steel pipe makers are now devoting attention is the coating of the pipes and this has now reached such a point of perfection that not only are the pipes amply protected from the effects of the surrounding soil and the flowing water, but they are able also to resist satisfactorily the effects of electrolysis. For example, it is found that when electric cables are laid in close proximity to cast iron gas or water mains, the effect is occasionally to form holes in the cast iron pipe almost as regular in form as if they had been drilled. In order to prevent this it is customary to link the cast iron pipes together with copper bands.

When, on the other hand, steel pipes are well coated with Dr. Angus Smith's solution and wrapped in tarred Hessian, the effects of electrolysis are practically eliminated. This is found to be the case in large centres in the British Isles where steel pipes are used to avoid the trouble which was experienced with cast iron pipes under electric tramway installations. The steel pipes are cleaned before they are dipped hot in a hot bath of coating solution, and as the coating adheres more easily to hot steel than to cast iron, it is natural that the efficiency of a coated steel pipe is better than that of a coated cast iron pipe which is more or less porous.

The Failure Features.

A few failures of steel pipe installations have been reported from time to time, but, when the causes of the failures have been thoroughly investigated, it is a question whether, under the same conditions, a cast iron pipe would have been able to show as good results. For example a steel main of about 39 miles in length was furnished to the town of Port Elizabeth, South Africa, and after about ten years' operation some portions of the pipe were reported to be corroded. Two well-known South African engineers were appointed to investigate and report on the condition of this pipe line. Their interim report was published about July of this year, and shows that while some corrosion has taken place in portions of the line, other portions are in first-class condition and that as far as external corrosion is concerned there is no need for alarm.

When this report was submitted, the engineers had not examined the pipes for internal corrosion, but the town engineer, who was appointed to report jointly with the consulting engineers, stated, that, as far as he was aware, no internal corrosion had taken place.

The pitting was due in some places to sulphuric acid resulting from oxidation of the pyrites in the soil. Six samples of the soil were analyzed at another section and were found to contain a number of pyritic and manganitic nodules and the pitting action was due to magnesium chloride and sulphuric acid resulting from the weathering of the pyrites. The action in the above cases was accelerated by the presence of brak water containing a large quantity of salts and dissolved solids amounting to not less than 1.0031 per cent. of volume.

It is evident that the conditions through which portions of this main pass are very destructive, as sulphuric acid is well known to be a very active solvent of cast iron and steel. It is quite certain that under similar conditions corrosion would be induced no matter whether the pipes were made of cast iron or steel.

The pipes used for the Port Elizabeth works were not wrapped with Hessian, whereas the practice adopted in Canada by all engineers who use steel pipes is to have them covered with this Hessian coating. Had the Port Elizabeth mains been wrapped with the Hessian no trouble would have been experienced notwithstanding the corrosive nature of the soil.

The good features of steel pipes are well known to water works engineers who have in the past been troubled by broken pipes and flooded streets. About 500 to 600 miles of sizes varying from 2 in. to 72 in. in diameter, are already in use in Canada for gas and water mains, and the demand is increasing rapidly from all parts of the country.

WASTEFUL COMBUSTION—THE SMOKE NUISANCE.

THERE is an aspect of this question of wasteful combustion and the smoke nuisance, writes a correspondent of the "Manchester Guardian," which continually causes wonder to those who come into close touch with the management of mills and works; it is the extraordinary absence of reasonably scientific methods in the average boiler house. The most up-to-date and exact principles are adopted and enforced in the engine-house and through all the different operations of production, but they so very often stop short at the steam generation equipment.

This is all the more remarkable when one considers how largely the item of coal at to-day's high price must enter into the cost of production, and one would, therefore, think that the most strenuous efforts would be made by every mill-owner to obtain perfect combustion and the most economical burning of his coal.

It is often the case, however, that a boiler-house is manned by stokers who are stokers only in name—mere laborers, who throw coal on anyhow, and whose only object is to keep up the head of steam.

Stoking is a fine art, and good hand-firing is probably as economical and produces as little smoke as any mechanical apparatus yet on the market. If our factory and plant owners could be influenced to put highly skilled and well-paid stokers in their boiler-houses, and relieve them of all other duties, such as oiling or attention to engines, they would do much to minimize the smoke evil so far as industrial smoke is concerned.

AIR CYLINDER LUBRICATION.

THE following data relative to the lubrication of air compressor cylinders appear in a pamphlet issued by the Fidelity and Casualty Company, and in view of the fact that air compressors form, in a large number of instances, a highly important feature of power plant equipment, the information should be not without interest to a wide circle of our readers.

"Recent disastrous explosions in air compressor systems present striking examples of the danger existing from use of ordinary engine oil in the air cylinders. Only a pure mineral oil, with a flash point as high as good lubricating qualities will permit, should be used. An excessive amount of oil should be kept out of the system.

"Numerous cylinder oils are compounded, and such oils are likely to produce a carbon that will stick the valves, and collect on the valve faces and other parts of the cylinder and valve chambers, resulting in a dangerous condition.

"Air receivers are liable to explosion from accumulated oil deposits. Every receiver should be equipped with a pressure gauge, a safety valve, and proper drains, and all reservoirs and likely places of deposit in the air line should be thoroughly and frequently drained and cleaned. It is bad practice to have the inlet of an air compressor taken from a hot or dusty room—the air should be cool and as clean as possible.

"The practice of throwing kerosene oil into the inlet of an air compressor to clean it is an extremely dangerous one, and the cause of an explosion under such circumstances is not difficult to understand. Lubrication of the air cylinder with soap-suds (preferably made of soft soap, about one part to fifteen parts water) for a few hours each week (or less frequently if the load is light), instead of oil, will help very materially in keeping the cylinder clean. The only danger from the use of soap-suds is rust, and this should be overcome by being careful to discard the soap and feed the cylinder with oil an hour or so before shutting down. The receiver blow-off should then be opened and the accumulation of oil and water drained off.

"An air compressor engine should not be controlled by the air pressure alone, as many are, but should be fitted with an auxiliary governor which will act as soon as the speed rises above a certain predetermined limit. This will prevent the engine from "racing," in case an accident to the tanks or piping causes a sudden lowering of the pressure. It is not necessary for an explosion to take place to produce a lowering of the pressure, as the giving way of a pipe, valve, or tank from any cause will have the same effect.

"The steel used in the construction of air receivers should be of the best quality, and should have a tensile strength of from 55,000 pound to 62,000 pound per square inch. The side seams should be double-riveted, or better still, be butt-strapped. The heads should be dished. The large sizes of receivers should be provided with man-holes."

SAFETY FIRST.

HERE are some "Safety First" maxims given out by Mr. N. S. Dunlop to a meeting of railway men at an address in Montreal:—

Don't throw anything out of a moving train. It's a bad thing to get a mail bag in the stomach from an express running 30 miles an hour.

A brakeman should not sit down on the track and be run over by the train he went to flag.

It takes less time to prevent an accident than it does to fill up Form 74 (the accident report form).

Don't fool with machines. They can be replaced. Hands cannot.

You can start a "Safety First" committee right in your own home.

Get the "Safety First Habit."

Stop supporting the undertaker and the artificial limb maker.

No man should go 24 hours without placing his insurance."

Mr. Dunlop is an enthusiast for "Safety First," a movement which was started on the C.P.R. so long ago as 1885. As Claims Adjuster of that Company, Mr. Dunlop has had to deal with many sad experiences due to neglect of "Safety First" principles.

C. M. A. SELECTS MONTREAL.

THE council of the Canadian Manufacturers' Association met in Toronto early this month, and in deference to the wishes of five-sixths of the membership residing in Ontario and Quebec, decided to hold next year's Convention in Montreal. The offers of Winnipeg and Calgary were, therefore, not accepted. The Canadian Manufacturers' Association has met but twice west of the Great Lakes—once in Winnipeg and once in Vancouver, and it was believed that as the middle Canadian West had never been favored with a Convention, the Calgary invitation might be accepted. It is known, however, that the Winnipeg and Vancouver Conventions were not a success in point of attendance.

DISASTROUS BOILER EXPLOSION AT MIDLAND, ONT.

TWO men were killed and three injured in a boiler explosion at the sawmill of Manly Chew, Midland, Ont., on the morning of Oct. 21. The installation consisted of a battery of four boilers, and, looking from the front, it was No. 2 that exploded, counting from left to right. Why it exploded has not yet been determined. A jury empannelled to inquire into the cause of the death of one of the men, returned the following verdict:—

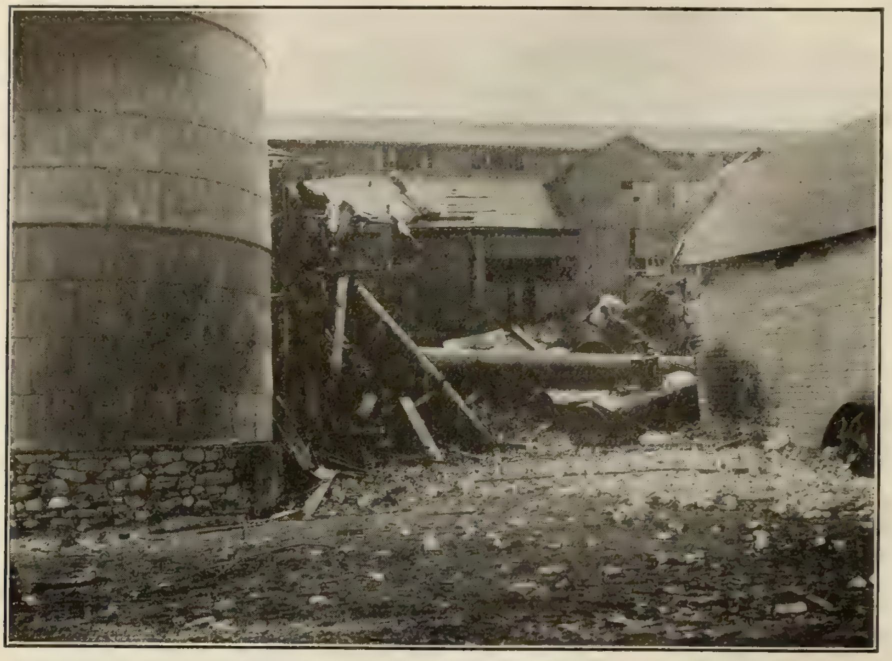

FIG. 1. FUEL HOUSE ON RIGHT, WHICH WAS MOVED SIX FEET. ALSO NO. 1 BOILER AND STACK.

"That the jury find that H. A. Sagar came to his death on Oct. 21st, 1913, at Mr. Manley Chew's mill by the explosion of a steam boiler, the cause of which is unknown, and, that his death, from the evidence given was purely accidental. We would recommend that the Government be requested to apply the same thorough tests to stationary boilers used for power purposes as that applied to marine boilers, and that a copy of the evidence and this verdict be sent to the attorney-general."

The jury was a very capable one, the foreman being a man who has had considerable experience with the operation of boilers.

The explosion being one of the most disastrous and, therefore, most important to occur for some time, the Government and several insurance companies are taking a keen interest in the matter. It is significant, however, that the boilers in this saw mill were not insured.

The mill had been running less than an hour on the day of the explosion. The engineer was in the engine room, and escaped; the fireman was in the fuel house, the small wooden building seen in the photograph, and he too escaped. Harry Sager, who was killed, was assisting to fire the boilers, and was blown through the brick wall, it is believed. The other victim, Freddie Fraser, aged 18, was a teamster, and was standing at the boiler house door, where he received the full force of the explosion, and was buried in the debris. Part of his wagon is seen in Fig. 5.

The boiler-room measured 130 x 40 feet, was of brick, and was completely demolished. It contained four horizontal return tubular boilers, 66 ins., diameter, by 14 ft. long, operating at 90 lbs. pressure. Each boiler contained 76 iron tubes 3½ ins. diam. All the tubes were blown out of the front head, Fig. 5.

The boiler shell was of 5-16 inch plate, and the heads of 7-16 inch iron plate, with double riveted, lap jointed longitudinal seams, having ⅝ inch rivets of 2 5-16 inch pitch. The circumferential seams were single riveted lap joints, with ⅝ inch rivets of 2 inch pitch. The heads were braced by two double angles, back to back, 3 x 3 x ⅜ inches, secured by 17 rivets of ⅝ diam. in the bottom pair, and 13 rivets of ⅝ inch diam. in the top pair. There were four diagonal stays on the bottom angle, and two on the top angle. The palm of stays were held by two ⅝ inch rivets. The size of manhole was 15 x 10 inches, as near as could be measured, it being badly fractured.

When the explosion occurred, all the safety valves were working freely, and blowing off at 95 lbs. pressure. The safety valves were 4 inches in diam., and of the lever type. The face of the explosion must have been backward and downward, as half of the back course was left almost in its original position on the foundations. The top half was found about 200 feet behind the boiler setting, and on the other side of the picket mill, so that it must have been blown completely over the mill.

The tubes and back head went forward sixty feet. The shell was fractured in all directions, and torn completely off the back head, and partly off the front head. Lamination was visible in many parts of the plating.

Fortunately, the fire in the boilers was blown towards the front, and clear of any rubbish or fuel, otherwise the whole plant would have been demolished by fire.

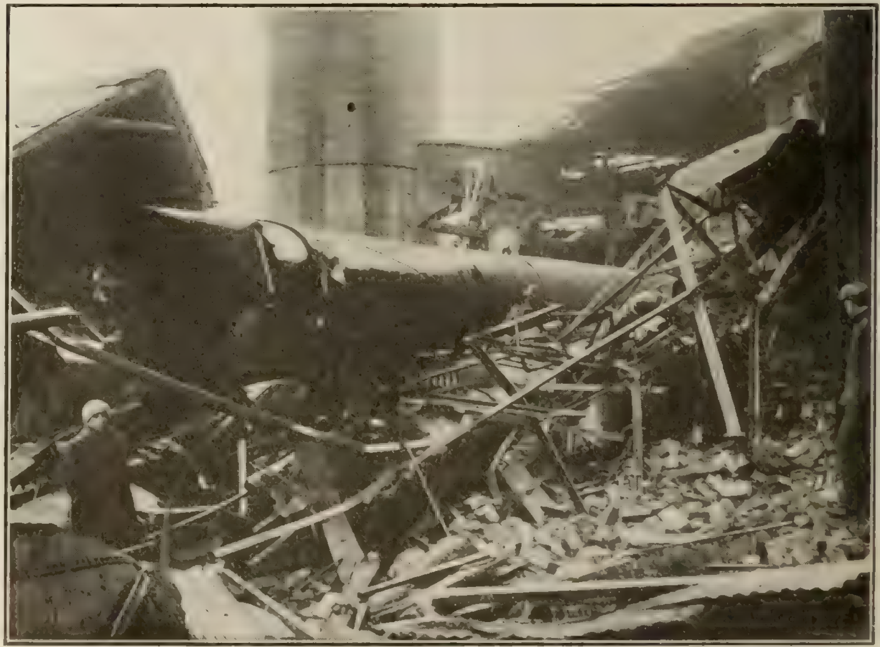

FIG. 2. FRONT VIEW OF BOILER HOUSE TAKEN FROM THE RIGHT.

Another piece of good luck was the fact that the employees around the plant were few in number that day, or the loss of life would have been heavier. The building in the rear of Fig. 1 is the picket mill, which was partly wrecked, and usually employs a large number of boys.

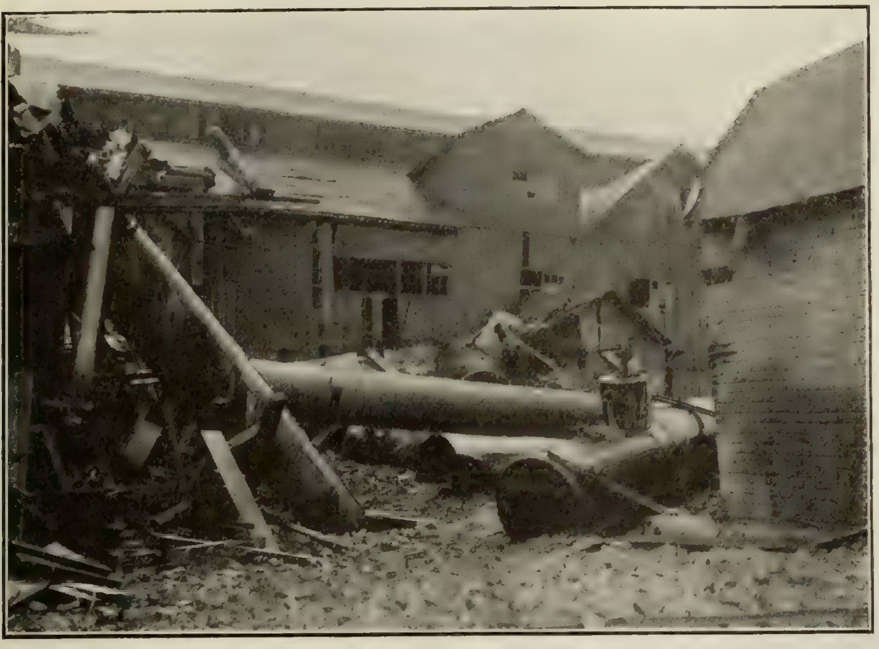

FIG. 3. STEAM HEADER SHOWING THROUGH ROOF OF MILL.

In Fig. 1 the wooden building on the left is the fuel house. It was pushed six feet to the right. Fig. 2 gives a view of the wreck from the front of the boiler house, from the right hand side. Fig. 3 gives a view from the left of the boiler house at the rear, and shows No. 1 boiler lying near the fuel house. Fig. 4 shows No. 3 boiler blown on top of No. 4, and the smoke stack in several pieces lying near. The building behind is the mill. The photograph, Fig. 5, was taken from the left front of the boiler house, Fig. 2 being from the right. In Fig. 1 a piece of the steam header can be seen in the roof of the building.

The boiler was blown to fragments, and the rupture apparently occurred along the longitudinal seam, on the right hand side, at the front end. The damage done amounted to from $12,000 to $15,000.

The liabilities have not yet been settled, and will probably be determined in the courts. S. M. Medcalf, chief inspector of steam boilers for Ontario, is conducting an investigation into the affair.

PACKINGS FOR FEED WATER PUMPS.

By T. M.

PERHAPS no other part of a power plant equipment should receive more careful attention than the boiler feed pump. The engineer has learned the vital importance of keeping this particular pump in as near perfect running order as possible and bends every effort towards this end. The conditions under which it operates are admittedly severe, and its failure at the critical moment may often be traced to design, material and workmanship, or to its accessories, such as oils, packings, fittings, etc.

The law of supply and demand pretty well regulates the design and construction of feed water pumps, and the reputable pump manufacturers are practically agreed upon certain standards which keep their records surprisingly free from complaints. The durability and successful performance of these specialties is usually the result of proper selection on the part of the engineer.

The ever varying conditions make the proper selection of packings for pumps a very important matter.

The feed pump piston packing is continually subjected to three conditions—high temperature, high pressure and water. Many meritorious packings will withstand one and often two of these conditions, but the skilled engineer will think carefully before adopting as a standard the packing best suited for all three of the conditions mentioned, and since the actual cost of a high grade packing required each time the pump is repacked will usually not exceed an average of more than $1.25, it is needless to observe that his judgment should not, and in most cases is not, influenced by the question of first cost. He knows that his superiors demand security, and his efforts are directed to that end.

As the opinions of professional men often differ sometimes widely on given subjects, just so will they differ among engineers as regards the type and construction of packing for this purpose, but well informed engineers all agree that in order to give them permanent security, the packing for this purpose should unquestionably be made of the highest grade materials obtainable, manufactured with care and precision and able to withstand the above mentioned conditions, viz., high temperature, high pressure and water.

It is not the intention of the writer to specifically mention in this article the names of packings which are most highly regarded for this purpose; but he will be pleased, from time to time, to make any suggestions or answer inquiries from our readers pertaining to this line.

MACHINING OF WHITE METALS AND ALUMINUM CASTINGS.

By P. W. Blair.

THERE has been, within the past few years a great demand for manufactured goods from the various white metals owing to the cost and wearing qualities of same. The following article, therefore, has been prepared in order to give the most important points on the above subject, based on practical experience during recent years.

Besides the well-known bearing metals, there is a long series of white metals which, according to the main constituents, may be reckoned as aluminum, tin, lead or zinc alloys. Without considering punched or pressed articles which are not worked upon with cutting tools, there are numerous objects which were previously made from brass or bronze, but which are now, on account of their improved appearance and wearing qualities, the reduction in weight or other properties, made from aluminum or other white metal alloys.

FIG. 5. FRONT VIEW OF BOILER HOUSE TAKEN FROM LEFT.

Aluminum Alloys.

Aluminum not alloyed with other metals is also used for a great many machine parts and devices. The automobile industries are large users of aluminum castings, also the manufacturers of pneumatic vacuum cleaners. Commercially, pure cast aluminum has a tensile strength of about 14,000 pounds per square inch, which is too low for many purposes. In order to increase the strength of aluminum, it is therefore, alloyed with other metals. So called aluminum-bronze is an alloy of copper with from five to eleven per cent. aluminum, which increases the tensile strength of the copper from 28,000 pounds per square inch to from 85,000 to 110.000 pounds per square inch. Aluminum-bronze is of a light yellow color, and is not as heavy as any of the ordinary bronzes.

It shrinks in casting about twice as much as the ordinary castings made from bronze containing tin, and must have heavy gates on same to insure success. The castings, therefore, are often porous and the increased strength rather imaginary. The casting of aluminum-bronze is, therefore, a difficult matter, and requires special skill in the molding, smelting and pouring of the metal to insure success. Alloys containing aluminum as a base and a small addition of other metals are, therefore, of greater value.

The alloy with magnesium is especially well known. Magnalium containing from three to ten per cent. magnesium, has two and a half times the tensile strength of aluminum, and is at the same time lighter, it has, therefore, been generally adopted in the building of aerial craft and has proven more successful than aluminum. The addition of the magnesium makes the metal firm and less tough, so that it can be worked more easily with cutting tools or machined. If the magnesium content is too great, the metal becomes too brittle and is useless.

Machining Difficulties.

The main difficulty met with in the working aluminum and aluminum alloys is the carrying away of the chips. Those become so firmly imbedded between the teeth of milling cutters, counterbores, and similar tools that they cannot be removed with a stiff brush, and the machine has to be stopped for their removal which makes operations slow, owing to time consumed removing the chips when they become clogged in the teeth of the cutters. The only way to overcome this to a great extent is to use the right kind of a lubricant. Oil cannot be used, as it is of no benefit, but soapy water gives good results, although leaving a dull surface.

The best cutting lubricant is kerosene, which gives a bright mirror finish when cutting tools are properly ground. The cutting edges of all tools should have sharp corners or edges. Rounded corners on tools and cutters are objectionable, and there should be plenty of cutting relief or clearance on the tools. For milling flat surfaces, it is best to use end mills rather than cylindrical cutters. The mills will cut best if a high cutting speed is used with a moderate feed. The depth and width of the cut is of less importance. A cutting speed of 325 ft. per minute can be considered as practical, and from 2 to 4 cubic inches of metal may be removed per minute in aluminum.

Britannia Metal.

Rolled Britannia metal is composed of from 90 to 92 per cent. of tin, from 4 to 8 per cent. of antimony, and from 2 to 2½ per cent. of copper.

Cast Britannia metal is composed of 80 to 85 per cent. of tin, 9 to 17 per cent. of antimony, 1 to 3 per cent. of copper, and from 0 to 3 per cent. of zinc.

Cast Britannia metal is less tough than the rolled metal, and is more easily worked by cutting tools. Cast metal can be worked without a lubricant when cutting same, which is not possible with the rolled metal. With the same cutting speed as is used for aluminum, from 1.25 to 1.5 cubic inch of metal may be removed per minute. The adding of antimony makes this metal more brittle, but also more easy to machine. A number of engine builders use a composition for white metal bearings, composed of tin 83 per cent., antimony 11 per cent., copper 6 per cent. This composition machines without lubricant and works freely.

White Metal for Pattern Work.

A white metal for pattern work, and in general use, giving good service, is composed of 3 per cent. tin, 1 per cent. zinc, 1 per cent. copper. This alloy is well adapted for pattern plate purposes, and works freely without lubricant on machine tools or files. Zinc is most commonly used for cast articles which are to be plated with copper or nickel.

Zinc Alloys.

Zinc is also used in bearing metals, because its cost is less than tin, and it stands wear better than lead. This bearing metal is composed of from 60 to 80 per cent. of zinc, from 10 to 35 per cent. of tin, 5 per cent. of copper, and a small per cent. of antimony. Zinc alloys can be easily machined dry. They have the disadvantage that the castings are somewhat porous, which causes trouble in the plating. Pure lead is very difficult to work and a very small feed should be used. The width of the cut can be of fair proportion on a slow speed with thin edged tool and plenty of clearance.

It may be generally remarked that it is impossible when working white metals to take full advantage of the efficiency of modern machines of cutting tools, and that the addition of antimony or magnesium to the alloys makes the metals mentioned more easily machined.

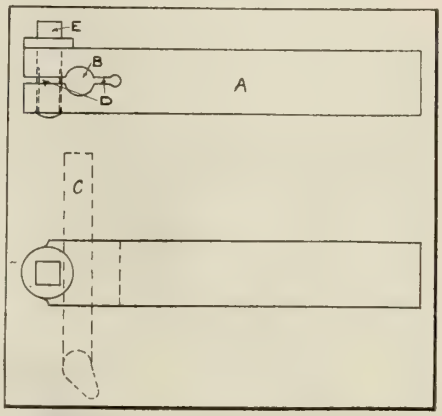
AN IMPROVED BORING TOOL HOLDER.

By W. G.

THE boring of small holes is very often a difficult matter, particularly when the operation is performed by means of the ordinary solid boring tool, the stem of which is not adjustable for length. This fact alone very often accounts for holes being out of true. The nearer the cutting edge to the tool shank the more rigid the tool will be in operation. This is of vital importance with boring tools, such as are generally considerably weaker than ordinary outside turning tools. The accompanying illustration shows an improved boring tool holder, particularly adapted for service with small boring tools of the type usually made from silver or similar bright drawn steels, the object being to provide means for adjusting length of tool in accordance with depth of hole to be bored, also means for positive clamping of tool, the combination thus securing the maximum of rigidity during the operation of boring. The tool holder (A) is preferably made from a piece of square mild steel, having a hole drilled through, as shown at (B) for the purpose of receiving the tool (C), shown dotted. The saw split (D) is used in conjunction with the pin (E) for the purpose of securing the said tool in any desired position.



IMPROVED BORING TOOL HOLDER.

LENGTHENING FEED SCREW FOR STONE LATHE.

By "Retals."

WE were recently asked to lengthen a 3 in. dia. 26 ft. long feed screw for a stone lathe to 36 ft. The job called for welding the extra length on the threaded part. Realizing that a blacksmith's weld would ruin about a foot of the thread or leave it in such condition that re-threading would be difficult and at best leave some flat spots, we consulted the local acetylene welders, who guaranteed, and later carried through an exceptionally good job. We took a bar of machine steel of the required extra length of the screw, plus enough extra for holding, turned the end down below the bottom diameter of the thread, and sent it to the welder along with the screw which we previously sawed off square. As already stated, an excellent welding job was made, although careful transportation was necessary on account of the length and danger of bending.

To machine the screw in the lathe—the longest available being 20 in. by 16 ft. centres—we took off the tailstock and put the welded part with the end turned down into a coupling fitted up as a positive chuck with 3 set screws held on the face plate, and let the other end extend out back of the end of the lathe, supporting it where necessary. We had to straighten it some where the ends were joined, but the weld stood the operation successfuly. A steady rest was placed at the extreme end of the lathe bed, and another close to the cutting operation to insure accuracy. The nut was solid, and we left it on the screw during welding so that we could cut the thread from the old part on to the new and have the nut handy for a sizer, and be sure that it would pass over the joint, also avoiding the otherwise necessity of taking the screw out of the chuck to try the nut on. Handling a long flimsy screw is no joke..

After we had the new part turned and the thread cut, the end bearing was turned and the extra length for holding cut off.

Extreme accuracy was not altogether necessary; our results, however, were good enough for the ordinary run of turning lathes.

FILLING OIL TANKS.

By J. E. McCormack.

WHEN filling 5-gallon oil tanks or cans from barrels stored in a cold place without the aid of an oil pump, the work may be hastened by fixing a nipple and piece of rubber tubing with mouth piece attached to the air vent; thereafter, by blowing through the tube, sufficient air pressure can be obtained in the barrel to greatly accelerate the oil flow. The tubing should be sufficiently light so that by squeezing it between the thumb and fore-finger, the pressure can be held inside the barrel while the operator takes a breathing spell.

* * *

SCREW THREAD DATA.

Threads per inch.	U.S.S. Thread.	V. Thread.
3	0.43333	0.57733
3½	0.37114	0.49485

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

10½-INCH VERTICAL SHAPER.

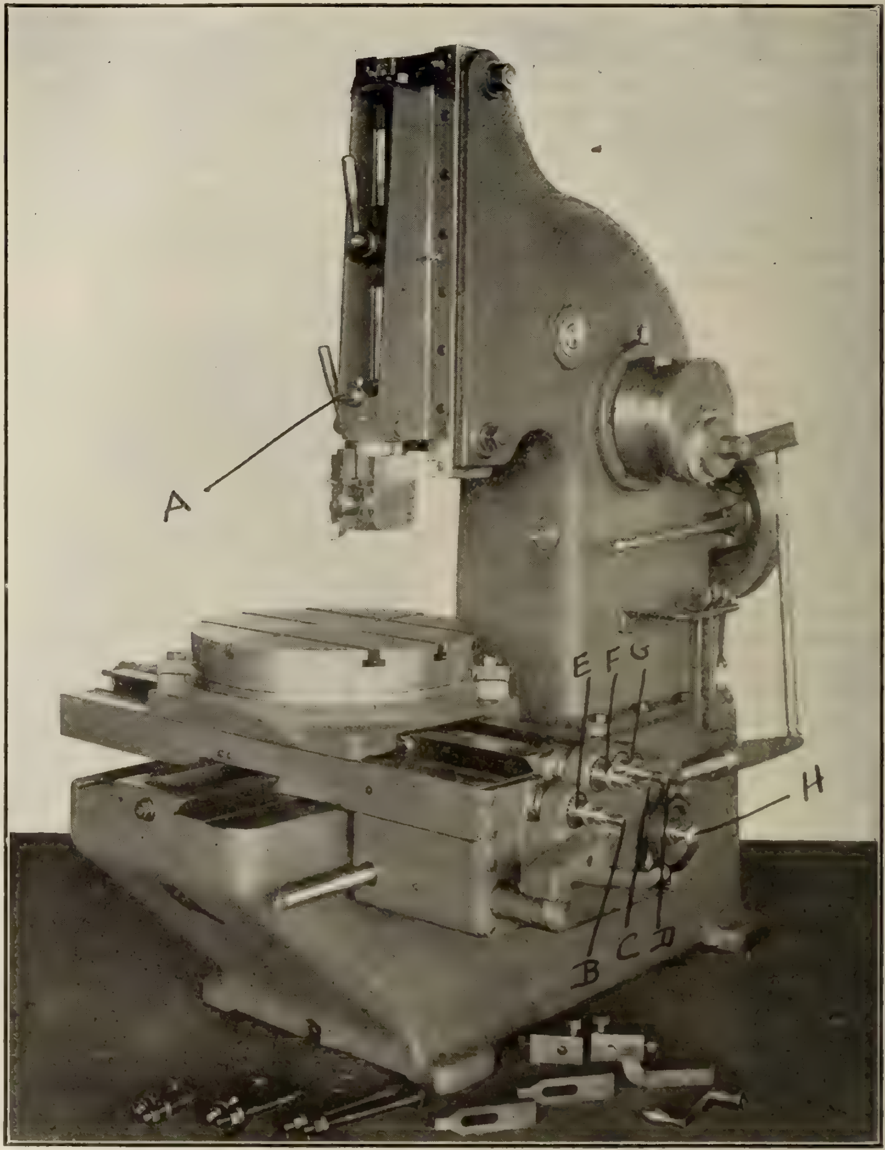
THE general design of this larger vertical shaper differs only slightly from the maker's smaller one, the most marked variation being that the rotary table is provided with power feed in addition to the hand feed, there being no provision made for the quick indexing of the table as in the smaller machine. It will also be noted that the means for relocating the ram is slightly different from the smaller unit. This machine is too high to permit the use of a hand wheel at the top of the ram, consequently the screw for adjusting this is actuated through beveled gears from shaft (A), the ram head binder being placed at the side so as to permit this. A powerful worm and worm wheel is used for conveying the power to the ram instead of spur gearing as used in the smaller machine.

The solution of the power feed problem is worthy of special attention. It will be noted that the entire mechanism is self-contained in one compact unit attached to the saddle at the right. The longitudinal, transverse, and rotary power feeds, also the hand feeds, are conveniently controlled from this unit. The transverse feed is conveyed through shaft (B); longitudinal through screw (C); and the rotary through shaft (D). In operating the hand feed, a crank wrench is used, the ends of the shafts being squared for this purpose. The various power feeds are engaged through the sliding pinions (E), (F), and (G). As shown in the illustration, these pinions are in the outward position, the power feed being inoperative. The pinions are advanced to the inward position for engaging the power feed by hand, and are made of suitable form so that this may be easily accomplished. The rate of feed is controlled through a feed pawl and ratchet, provision being made for conveniently obtaining any desired variation. The direction of the feed is controlled through knob (H), it being pulled in or out according to the direction desired.

In the design of this machine, features are incorporated which make it possible to conveniently handle slotting machine work, also the regular line of work handled on the horizontal shaper. The range of work which this machine is capable of handling is so large that there ought not to be the slightest difficulty for users to keep it supplied with work. This is a very important point.

The machine is proportioned to give high stability, and an abundance of power sufficient to meet every requirement, while the operation strains tend to hold all of the parts such as knees and slides together. All of the operating requirements are within easy reach of the operator, and may be conveniently controlled. Angular adjustment to the ram is provided.

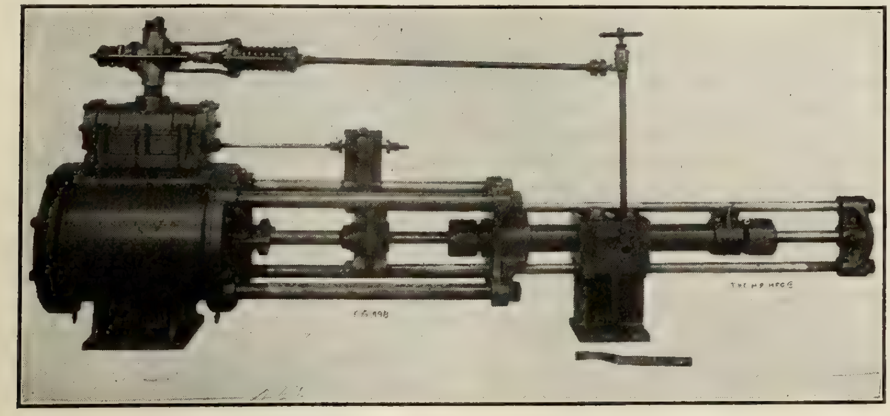
The feature of swivelling the ram head which permits the location of the cutting tool in the most convenient position is also a valuable feature. With this construction, the various sides of certain work can be planed at one setting. The feed always takes place with the ram at the extreme upper position, when the tool is clear of the work. The tool post is mounted in a clapper which prevents the tool from being injured due to dragging on the return stroke. Provision has also been made whereby the clapper may be bound solid with the head in case exceptionally long tools are used for internal work. The ram may be stopped and started entirely independent of the countershaft by means of a friction clutch easily controlled through a conveniently placed lever. The driving mechanism is so constructed that it forms a perfect counterweight for the ram, thus a free, easy running action is obtained. Micrometer dials are provided for accurately governing the various feeds. A graduated dial is also provided by means of which the correct length of stroke may be readily obtained. The floor space occupied is 6 ft. by 7 ft. 6 in., while the height is 8 ft. 6 in. Pratt & Whitney, Hartford, Connecticut, are the manufacturers of this product.



PRATT & WHITNEY 10½ IN. VERTICAL SHAPER.

HYDRAULIC STEAM PUMPS.

A NEW line of hydraulic steam pumps has been designed by The Hydraulic Press Mfg. Co., Mount Gilead, Ohio. This new design is the result of an extended experience in designing, building and operating hydraulic presses, pumps and valves for a wide variety of high pressure purposes.



HYDRAULIC STEAM PUMP.

Based on the steam end dimensions, the line covers twelve sizes, and on the water end dimensions seventy-one sizes. This pump is of the single cylinder, double acting pattern, and is shown by Fig. 1. The notable features are as follows:—

1.—Long stroke of steam and water pistons, the stroke being longer than provided in previous designs. Elaborate experiments and experience have proven that a long stroke is more economical in steam consumption for pumps of different capacities. The number of strokes or reverses are less. This reduces slippage at the water valves as well as the wear on all moving parts. Another advantage is that a given steam piston can be used with a small water plunger to give the same capacity. On this account the steam pressure may be reduced for a given water pressure, therefore the advantage of a lower steam pressure is gained. A pump having a long stroke with given steam and water ends has a larger capacity, hence a greater value than the average pump with shorter strokes having the same size water end.

2.—Design of valves and gears prohibits short stroking.

3.—Steam valve gear permits adjustment to be made while pump is in motion.

4.—Cushioning of moving parts is fixed and positive, and does not require adjustment.

5.—Steel forgings are used for all water ends for pressure above 2,000 lbs.

6.—Large water valve areas.

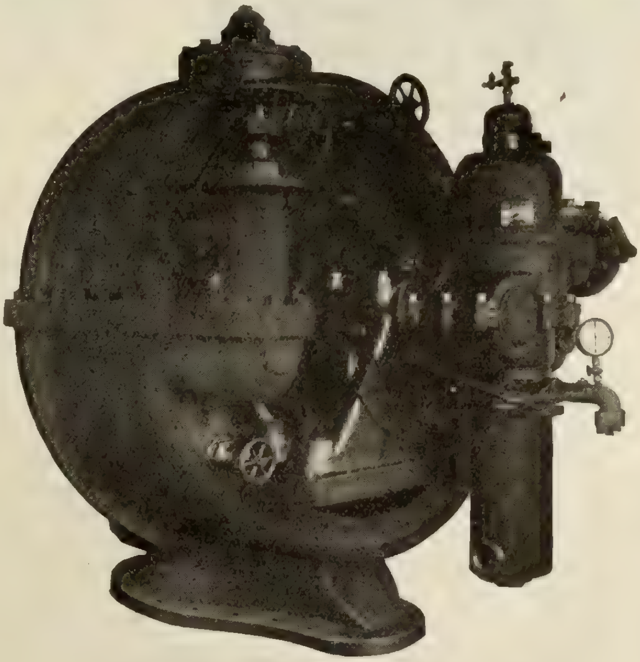
7.—Removable valve seats.

8.—Even compression in tightening hydraulic packings.

9.—Accessibility of all parts.

Pressure and Speed Governor.

Fig. 2 shows the Mount Gilead pressure and speed governor which regulates the speed and pressure of the above described pump. It provides a simple and automatic control for all makes of hydraulic steam pumps.



NEW TYPE TERRY CONDENSING TURBINE.

This governor is provided with an adjustment which can be set to govern any speed and pressure desired. Two important things are accomplished by the governor without the attention of the operator. First, it cuts off the steam supply to the pump when the predetermined maximum pressure is reached, thus preventing possible breakage of pump, presses and fittings through excessive pressure. Second, it regulates the speed of the pump to any number of strokes for which it may be adjusted, thus preventing the pump from racing, should the pressure be released suddenly.

* * *

NEW TYPE OF CONDENSING TURBINE.

TWO main objects have been kept in mind in the design of the latest type of Terry condensing turbine. These were an economy approaching that of the larger units used in power installations, and the overcoming of the old trouble of air leakage into the condenser.

This air leakage, it is claimed, has been completely overcome. The only gland exposed to vacuum has been shift-

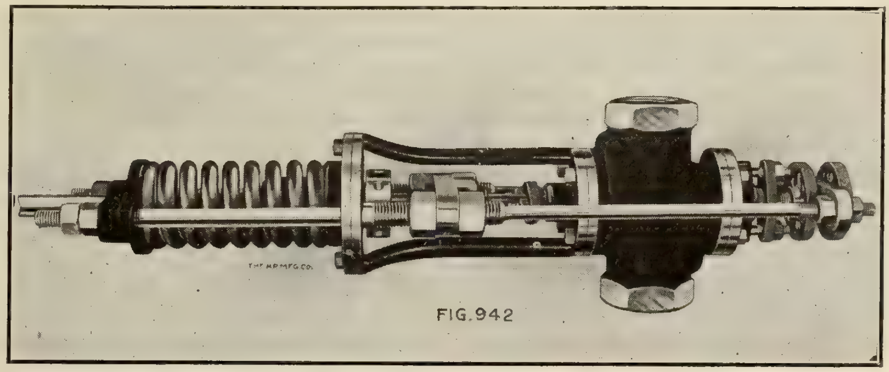


FIG. 942

HYDRAULIC STEAM PUMP PRESSURE AND SPEED GOVERNOR.

ed from the end of the casing to the middle, where it is exposed on one side to vacuum and on the other to steam at just above atmospheric pressure. This makes the leakage of air through this gland almost an impossibility.

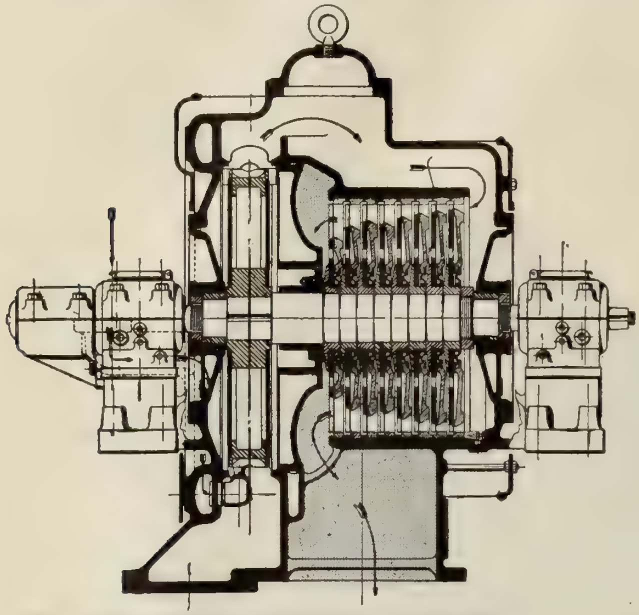
The machine consists essentially of a regular Terry multi-velocity wheel as the high pressure element, and a low-pressure end consisting of several multipressure impulse elements. The main feature distinguishing the arrangement of this low-pressure element lies in the fact that it has been turned end for end, receiving steam at the end farthest from the high-pressure element and exhausting into the condenser connection at the centre of the turbine. By this simple device of reversing the flow of steam, and thus protecting the vacuum glands, the old trouble of air leakage has been eliminated.

This turbine has the regular Terry characteristics, including casing split on the axial plane, permitting examination of the runner without disturbing steam or exhaust connections. It has the Terry indestructible high-pressure element which permits starting up the turbine from cold, even though a large quantity of water is thus thrown through the blades.

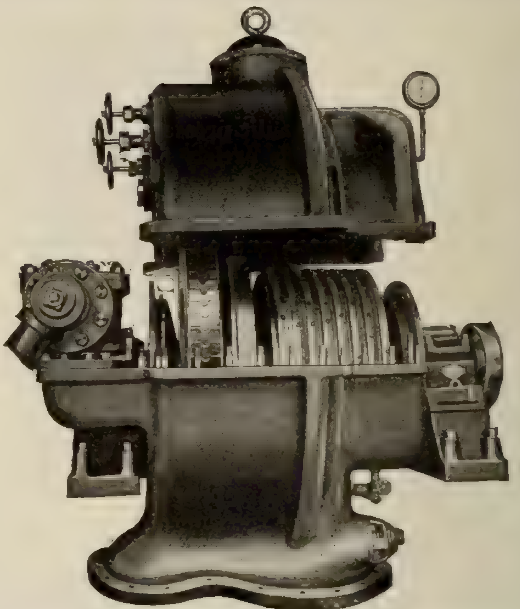
The stationary buckets in the low-pressure end are placed on annular rings, from which they may be removed in blocks as necessary. These rings are not fastened to the casing, but are bolted together and remain with the runner when the casing is removed, as will be noted in the illustration. They are held by friction to the casing when the upper half is drawn down tight to the lower half, and, hence, always retain their position when the turbine is running. The arrangement makes it very simple to examine all parts with a minimum of trouble.

The method of swinging the casing from the bearing blocks instead of from the base, makes it always concentric with the runner. Expansion is radial, and all clearances are maintained practically the same when the turbine is running as when it is cold. The side of the bearing in the pillow block is cylindrical. This is bored at the same time as the casing and from the same centre. It follows, therefore, that under no circumsances can the axis of the runner get out of line with the axis of the casing.

This new design of turbine is being applied to three principle uses:—Driving electric generators, blowers and centrifugal pumps. In all these uses we are informed the Terry turbine has made such a record that fully 80 per cent. of the more than 1,600 units which have been been put to work have been sold on repeat orders. It is of interest that the largest number of repeat orders have come from the United States navy and the British admiralty—two customers of extremely critical tendencies and requiring exceptionally severe tests of every unit purchased. There are more than 300 Terrys in use in these two services, all three of the above purposes being represented.



NEW TYPE TERRY CONDENSING TURBINE.



NEW TYPE TERRY CONDENSING TURBINE.

MONTREAL MUST IMPROVE HER GRAIN FACILITIES.

"IF Montreal wants to hold its grain trade, the facilities for handling should be improved at once, as well as the canal system leading to the port," was the statement made a few days ago by President Ross of the Harbor Commissioners, who went in company with Commissioner Labelle and Assistant Secretary Fennell to Buffalo to investigate the reason for that city getting much of Montreal's grain business this year.

Mr. Ross stated that owing to the low rate of freight to Lake Erie ports of 1¾ cents compared with 2½ cents per bushel last year, several millions more bushels of grain would pass through Buffalo this year than last.

"The type of grain business in Buffalo is different from that in Montreal," said Mr. Ross, "inasmuch as the bulk of the shipments is made by railway car to the seaboard, which does not require any conveyor system like this port, where over ten miles of conveyors are in use at the present time."

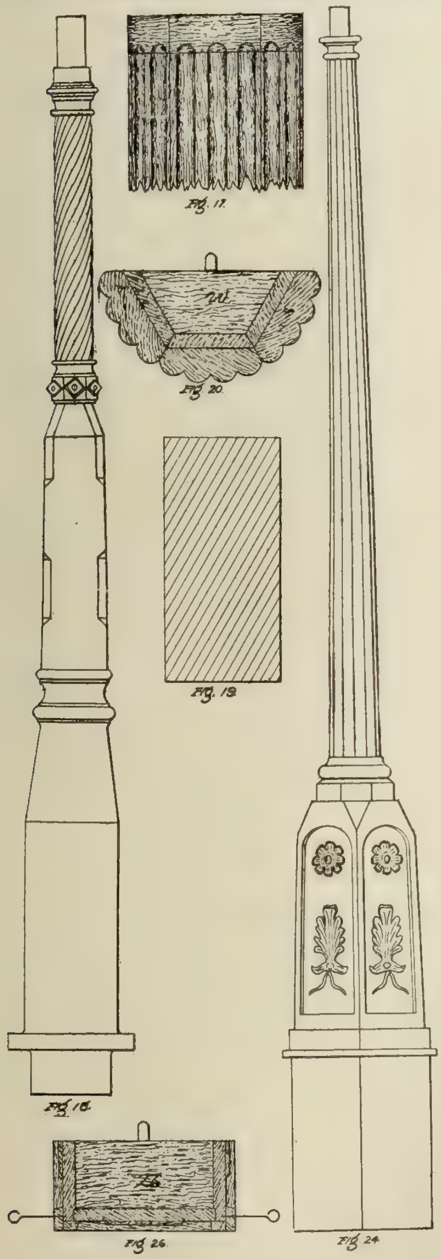
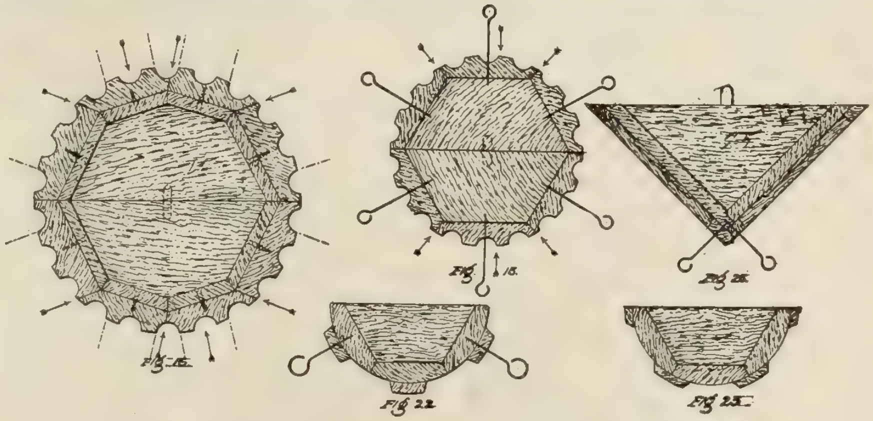
CARVED LAMP STANDARDS.

By Joseph Horner.

THE shafts of lamp standards vary much in design. The plain shaft shown in a previous article requires only the longitudinal middle joint, but other forms must be treated similarly to ornamental work, that is divided into strips to be withdrawn separately. The commonest form is the fluted. The flutes may be deep, approximately semi-circles, or shallows; the latter requiring a smaller number of joints for withdrawal than the former. Methods of jointing are shown in Figs. 15 and 16. The joints are made either down the centre of a flat or along an edge, never at the bottom of a flute. If a fin occurs there, it would be very troublesome to chip or file or grind it off within the flute, while it can easily be removed from the plain flat. The jointing may be radial, but it is better not so, delivery of deep flutes being favored by a more or less diagonal form of joint, as illustrated.



FIGS. 17, 18, 19, 20, 24, 26. CARVED LAMP STANDARDS.

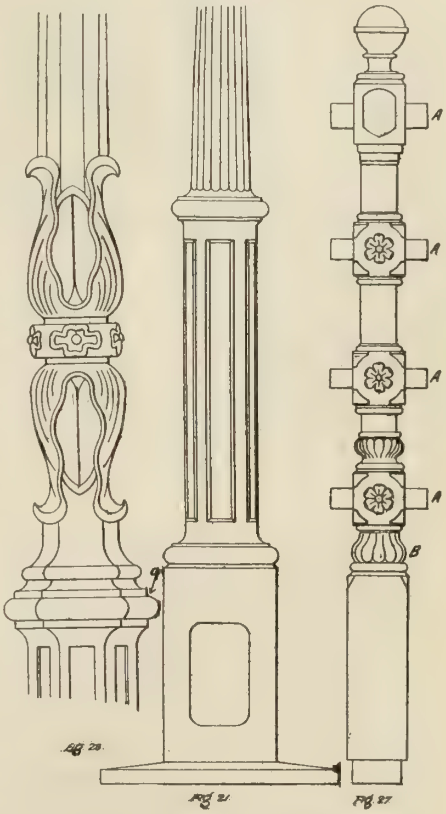


FIGS. 15, 16, 22, 23, 25. CARVED LAMP STANDARDS.

The fluting pieces may be fitted on the solid body of a pattern, as in Fig. 15, or on the laggings of a built-up pattern, Fig. 16, but they should never be bedded directly on cross bars with no other backing, because, unless then made exclusively thick, they would be rammed inwards in the areas between the bars. It is better to fit the flutes to flat faces as shown than to a turned body, because that is more easily and quickly done.

The pieces in which the flutes have to be worked are fitted in place, held with screws and turned, and the flutes marked on them. They are then removed and worked with planes, along the greater portion of their length if the ends terminate abruptly, leaving the ends to be finished with a gouge. A method by which the flutes can be planed throughout is to fit ends across Fig. 17, and screw them on at first, removing them when planing the flutes through, and replacing and working the small radius with a gouge. Sometimes instead of hollow flutings, convex ones are employed. Jointing must still be done, and the number of lags will also depend on the depth of the flutings.

Another form of standard has spiral flutings, Fig. 18. The section at right angles to the spiral is convex. The best way to work these is to mark diagonals on a strip of paper at the angles of the spirals, Fig. 19, the paper being equal in length to the shaft or made in short lengths, and in width to its circumference, and so that the diagonals shall meet and match when the paper is glued round the column. The working is done by the help of a templet. A cut is run round each spiral with a tenon saw to the depth of flute, after which the convexity



FIGS. 21, 27, 28. CARVED LAMP STANDARDS.

is worked with chisels]. How much jointing may be necessary depends on the depth of the flutings. Three strips in each half should be ample in most cases, Fig. 20. An unnecessary number of joints should be avoided because the marks of the joints always show to a greater or less extent on the casting.

Another pattern adopted in the bases of many standards is a panelled one, Fig. 21, which may have plain panels only, or the panels may enclose various devices. How these shall be moulded depends on the shape of the column and on that of the devices. Such a column may be cylindrical, or square, or polygonal. Generally, some portions must be left loose.

In a circular lamp standard, the pattern joint may be made as in Fig. 22 or Fig. 23. The first entails making two pieces on each half loose, but in the second case, if a large quantity of taper is planed, or if a radius instead of a taper is put, these pieces may be left fast. In a polygonal section, some pieces must be left loose, while in a square section, Fig. 24, it is almost always better to joint the pattern diagonally "across corners," Fig. 25, because delivery is much facilitated thus. Unless the strips are tapered a good deal at the edges, the lower strips must be left loose as shown. Usually too, any devices which occupy the panels, Fig. 24, must be loose, the alternative being to give them a great deal of taper and make them rather shallow.

Cases occur in which patterns having square sections cannot be jointed diagonally. They are then done parallel with faces, Fig. 26. In small patterns for handrailings, like Fig. 27, holes have to be cored to pass gas tube through, and the necessary provision of prints (A) settles the method of moulding on the square. The rosettes on the faces are then made fast. With care to avoid undercut, the small flutings on the lower part of the pillar at (B), can be cut in the solid.

Our last illustration, Fig. 28, shows an ornamental portion in which the pattern work may be cut solidly. The joint between the main shaft and the base is at (a), and the portion in the vicinity of (a) is polygonal in shape, which can be worked solidly. The panelled portion of the base below (a) may be treated like the round shafts in Figs. 22 and 23, strips being left loose or fast, depending partly on their thickness and partly on the amount of taper given to the edges. None of the carved work above (a) need be left loose, provided there is no undercutting in the main portion of the device or in the veining. A casting of this kind where there is considerable difference in the diameters must be cored out, the core following the outlines approximately.

With regard to the general methods of moulding these columns they are in the majority of cases simply divided down the centre, and moulded by turning over in the regular column boxes used in foundries. The smaller patterns such as that in Fig. 27 will, though made of mahogany be liable to warp in course of time in the stores and in service. A good method then is to plate them, putting each half on a centre joint-board, and then ramming each half box against the opposite faces of the board. When this is not done, the half-pattern which goes in the bottom should always be rammed on a board which goes in the drag before turning over, and ramming the other half of the joint on it. By adopting these precautions, the moulds are made straight, and, if the cores are centred properly and chapleted and the thickness kept equal, the castings will come out straight instead of crooked. Columns are generally poured at one or both ends, depending on their length, with a riser or flow-off gate at about the centre. If poured at one end only, the riser will be at the opposite end.

◆

BURNISHING METAL.

METALS for various purposes, says "The Ironmonger," are commonly ground bright on stones or wheels of different grades; cut down and polished with various buffs and mops; filed up and burnished, or turned smooth and burnished. Cheap work is usually polished only, but good class articles have time spent on them and the process of burnishing is employed.

There is a big difference between polished and burnished metal, and taking brass as an example, that difference is decidedly marked. Polishing abrades the surface, while burnishing flattens the grains of metal. A polished metal, if properly burnished, has a far finer appearance than one which is merely polished. Compare, say, a brass gasfitting having burnished bands on it, with some polished door-lock furniture, and the advantage of the process will be seen at once. Seen by itself, the lock furniture looks presentable, but, when contrasted with the burnished work, it appears commonplace, lacking the golden appearance which burnishing gives.

Where the articles are round and can be dealt with in a lathe, this method of working is preferable. The succession of cuts produces a smooth surface if the tools are of the right shape, nor will scores or scratches show if the work is carefully done. With handwork, files must be used of succeeding fineness, each one removing the marks of its predecessor, until in the end a dead smooth file leaves the surface in a polished state, free from any marks visible to the naked eye. The use of emery cloth or other similar material is to be deprecated. These leave pieces of grit or specks of hard material in the skin of the metal which catch the burnishers, and a minute grain of, say, emery will spoil both burnisher and work.

Hook and dagger shaped burnishers, which are generally used, are made of hardened steel, very highly polished. During use they must be kept polished on a strip of buff leather attached to a board, and dressed with fine crocus or Tripoli powder. When working on steel, soapy water may be used as a lubricant, but with copper, brass, bronze and the like, stale weak ale or table beer may be used with the burnisher. In using a burnisher in the lathe, it is held against the work with considerable force, the lubricant dripping on the burnisher the whole of the time. Burnishing should be continued until the work has a surface as smooth as glass. With handwork the burnishers are used with heavy pressure, moving them to and fro until the desired effect is produced, plenty of lubricant being used. From time to time during use the burnishers have to be wiped dry and polished.

To remove old burnished work, it must be boiled to remove the dirt and old lacquer, then pickled and dipped, after which it is rinsed and dried, and burnished again. Burnished work is finally lacquered to prevent oxidization, and then it is sometimes necessary to rinse the work to remove the dirt consequent on the use of the burnisher. Careful drying is essential in such cases, plenty of hardwood sawdust being utilized for the purpose. In all cases, lacquering should be done as soon as possible after burnishing.

◆

Government Issues Warning.

The attention of the Minister of the Interior has been called to the fact that certain promoters are inaugurating an extensive stock selling campaign, especially at Calgary, Alta., based largely on a proposed power development project on the Bow River within the city precincts, or a very short distance from Calgary. As no authority has been or is likely to be given for a power development within the district in question, he has instructed J. S. Challies, superintendent of the Water Power Branch, to inform the general public through the newspapers that stock in any Company has no value whatever, as far as a power project on the Bow River within the limits of the city of Calgary is concerned.

TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada To Achieve and Maintain a Dominant Place in the Markets of the World

An Industry That Never Came.

Most towns in Canada welcome with open arms any industry that comes their way, therefore, it was not surprising that the Press of Montreal was jubilant when James Warren opened offices in that city, claiming that he had just arrived from Great Britain, and that his mission was to establish a branch factory of the Peerless Motor Co. in Canada. Mr. Warren rented a suite of rooms in a large building on St. James Street, and a sales warehouse on Bleury Street. Big signs and streamers across the street announced the arrival of the new motor car industry, while one Montreal newspaper informed the public that they ought to feel proud that Mr. Warren had chosen their city for his plant, adding that he would manufacture motor cars and motor cycles. Several men prominent in shipping and industrial circles were given responsible positions in the new concern, which was to have a capital of $500,000. Mr. Warren paid all his debts by cheque, and as these were not honored by the bank, the employees and other debtors demanded an explanation, whereupon Mr. Warren departed for Toronto, and has not been heard of since. Several people who took stock in the concern are, as a consequence, getting rather anxious. When British manufacturers come to this country, they do not open offices in this flamboyant style, being as a rule, rather too quiet, if anysthing, about the matter.

American vs. British Tools.

It is generally understood, especially on this side the Atlantic, that the American is pre-eminent in the manufacture of machine tools. He has been the pioneer in many branches of the work, and American manufacturers are to-day doing a tremendous business in European countries in machine tools. Americans, are often staggered when they learn of the marked advances which British manufacturers are making along these lines, and it is interesting to note the opinion of an English tool maker, who has recently visited the States, and is now travelling in Canada. Walter Deakin, M.I.M.E., managing director of H. W. Ward & Co., machine tool makers, Birmingham, Eng., during an interview in Montreal last week, stated that he was a little disappointed in the United States, as he had found that machine tool makers there were not as far advanced in the business as their advertisements had led him to believe they were. The supremacy of the British manufacturer was not in any danger from the American shops yet, he said. At the same time he admitted they were very aggressive, and were doing a big business in the overseas markets.

More Rolling Stock Wanted.

Those who became alarmed some weeks ago when a Montreal newspaper stated that the car companies would soon be closing down for want of business, will be relieved to learn that the Dominion Government is in the market for new equipment for its railways. Both passenger and box cars are required, but the latter especially are in great demand, owing to increased business on Government lines. It will surprise these people to learn that the Moncton shops of the I.C.R. are overtaxed, and additions to the plant will shortly be required. The C.P.R. are also greatly increasing their output from the Angus shops, indicating that they are looking forward to bigger traffic records. For the five weeks ending November 5, these shops supplied 233 cars of all kinds, and seven locomotives.

Smoking in Factories.

Probably no city in Canada has been the victim of so many fires this year as Montreal. Many of these have been of a suspicious nature, and many undoubtedly of an incendiary origin. There were others of almost equally criminal origin which the authorities would class as "genuine" fires, but which might have been prevented had greater care been exercised. In an effort to reduce the fire loss in Montreal, representatives of the Board of Trade, Chambre de Commerce, the Canadian Manufacturers' Association, Builders' Exchange, the Canadian Fire Underwriters' Association, and the Architects' Association have submitted recommendations to the Board of Control, one of which favored the prohibition of smoking in workshops, factories, places of amusement, and other buildings. Fires are often unjustly blamed on defective wiring, whereas in many cases, if the truth were only known, the cause was due to a cigarette or match. Smoking in some factories, such as woodworking establishments, should be rigorously forbidden, and is forbidden where the manager has any regard for safety. On the other hand, there are plants where employees might smoke with safety if they did not abuse their privilege. When such privileges are permitted, the workman is often careless in throwing away matches and cigarette ends, which often find their way into the wastepaper basket or on to a heap of rubbish. We know of one large drawing office in Toronto where smoking is permitted, and if there is not a fire there some day, it will only be due to the kindness of Providence.

A Large Eye Magnet.

Machinists and other steel and iron workers in Fort William, Ont., are fortunate to live in a city with so efficient an institution as the McKellar Hospital. Ten city doctors have conjointly purchased a powerful eye magnet, and presented it to the above institution. It is an electro-magnet, with a pulling power of 640 lbs. to the square inch, and was purchased from Moyrowitz Brothers, New York, for $500. In and around Fort William there are a number of large engineering works of such a character than men are constantly made victims of flying steel chips and filings. Most large plants have their own eye doctor, usually a foreman or a workman who has become proficient at extracting specks of steel from the eye. At best this method is crude, and machinists often lose their sight through not receiving proper attention at the right time. This eye magnet is a valuable acquisition to the McKellar Hospital, and engineers in other cities would do well to urge their own hospitals to do the same.

Canadian Steel Trade.

Mr. J. H. Plummer, president of the Dominion Steel and Iron Co., has attracted considerable attention by his recent efforts to raise money in England to finance new improvements to the plant at Sydney. Speaking to the London correspondent of the Montreal Star, he expressed the opinion that the slackening of the Canadian iron and steel trade had been in imports rather than in manufacturing. The Canadian home demand, he said, was so large that there was little chance of exports to the United States. As for the United States tariff, he thought it a good thing to have this removed as it would provide a market at the door in case of dull times at home. Recent returns show the Dominion Steel

Corporation to be doing big business, but we know of other makers of steel who are crying out for business and cannot get it. Incidentally, the importation of American steel and iron continues almost unabated. An American firm secured a big order from the Toronto city corporation a week or so ago for an enormous amount of steel piping, while in the West it seems the proper thing for contracts to go to Pittsburg and the Western States. Last week, ten car loads of steel, consisting of sheets and plates were unloaded at New Westminster, B.C., for the Vulcan Iron Works, after being brought from Pittsburg, via New York and the Horn. If Pittsburg is able to secure the British Columbia trade now, how much easier will it be when the Panama Canal is opened for traffic?

Georgian Bay Canal Again.

There are two sides to most questions, and there are two sides to the Georgian Bay Canal question. Towns like North Bay and Ottawa take it very much to heart when cold water is thrown on this scheme, as these are the places which expect to reap a rich reward when the canal is constructed. On the other hand, towns and cities like Toronto and Welland, which deprive considerable profit from the Welland Canal, are never happy unless praising their own route to the West, and calling attention to the deplorable waste that would result from the canal further north. In Montreal, opinion seems to have been somewhat divided, and there are many in the metropolis who doubt the feasibility of the project. Nevertheless, the Montreal Board of Trade has deemed it wise to jog the Government a little on this matter. Having heard that a proposal is on foot to appoint a commission to enquire into the commercial feasibility of the scheme they ask that Montreal be given a voice in the appointment of its members. After discussing the matter at great length, the Board of Trade drafted a resolution and sent it to the Premier and the Hon. Frank Cochrane, stating that in view of the fact that Canadian grain for export is being diverted through American channels, it is of vital importance that the Georgian Bay Canal be constructed. It is there that the shoe pinches Montreal, because only for the Erie Canal, the present route would be entirely satisfactory to that city. If the Georgian Bay Canal were constructed, Montreal would benefit doubly.

The Coal Fields of Alberta.

Lots of people believe that, outside of the coal fields of Cape Breton and Vancouver Island, there is little coal to be found in Canada. Thus, it is somewhat startling to be told that 14½ per cent. of the total coal resources of the world, is in Alberta, estimated at 7,396,551,000,000 tons. Statisticians in the employ of the Alberta Department of Mines have estimated that it would take four million men, each producing five tons a day and working 300 days a year, 179 years to mine this immense field of coal. The output in Alberta last year was 3,500,000 tons, against 13,000,000 tons for the whole of Canada, including the Yukon. These are startling figures to those who have not followed the coal situation closely. They prove that the future of Canada, and especially the Canadian West, as a great manufacturing country is assured. Gradually industries which require coal and coke are opening up between Winnipeg and the Rockies, and gradually this big tract of coal is being opened up. The day is not far distant when Canada will mine her own coal, and a stiff tariff will be needed for protection.

Mayor Boosts His Town.

Mr. Bernier, M.P., the Mayor of Levis, Que., has been in London, Eng., studying shipping matters. Incidentally he has been giving the British shipping world a lesson on Levis, emphasizing the importance of the Government drydock being built there. This dock, which will be on the south side of the river, will mean as much to Levis as to Quebec, and the mayor has not been slow to appreciate the value of boosting. While in the British capital, Mr. Bernier took pains to advertise his town as a good site for manufacturing and shipping enterprises. Levis has several prosperous engineering firms within its boundaries, including a well-known shipbuilding yard, but with its leading machine shop it has been most unfortunate. During the last forty years it has been in several hands, the last being the Canadian Shoe Machinery Co. now in liquidation. There is some talk of a new syndicate taking it in hand. Under good management, and manufacturing a good line of machinery, it should do well, for it is well-equipped, and employs from 300 to 400 men. Under the last regime, shoe machinery and a variety of other lines were made. While there is a good market in Quebec and Ontario Provinces for shoe machinery, makers of this class of goods have not met with success, the competition from the United Shoe Machinery Co. being so severe. The Canadian Shoe Machinery Co. of Levis, is not the first concern of this kind to assign in the last few years. For some time George T. Davie and Sons, shipbuilders, have been using the shops to manufacture equipment for their yards.

A Point in Law.

J. W. Hamilton and F. Richfield agreed to form a company in Medicine Hat for the purpose of running a machine shop. The former supplied the funds, the latter supplied $3,600 worth of machinery, and became manager. The plant was known as the Industrial Iron Works. They endeavored to sell stock and form a joint stock company, but failed to dispose of that commodity. Hamilton, therefore, asked that the business be discontinued, while Richfield suggested that he operate the plant for a short time until a sale of stock could be effected, and agreed to pay Hamilton $50 a month interest on his capital. The plant was operated for two more months, and then Hamilton asked for a settlement and possession of the property. Richfield refused, saying he was acting for the company. Hamilton replied that no company had been formed, and that Richfield being his tenant, he could end their agreement when he liked. The case went to court, and the judge ruled that Richfield had no right to possession of the property, and gave him ten days in which to remove his machinery.

C.P.R. Car Output.

The turning out of 10 steel freight cars a day, and from 8 to 10 steel passenger cars a month, is the capacity of the latest addition to the Angus shops operated by the C.P.R. at Montreal. The new buildings for the construction of steel cars are now operating in full blast, and already over one hundred freight cars have been added to the Canadian Pacific Railway Co. rolling stock. Officials of the railway express appreciation as to the manner in which the new manufacturing equipment has been placed. In the month of April, work was started on the buildings, and, in the record-breaking period of five months, everything was completed and the first steel freight car turned out. By the end of September, the sixth month, 68 cars started in as freight carriers between the Pacific and the Atlantic oceans. The buildings consist of two structures 100 feet by 200 feet and 100 feet by 182 feet respectively for the manufacturing of both classes of cars, a building 72 feet by 405 feet for the exclusive manufacture of freight cars, and four buildings 226 feet by 208 feet for passenger car work. The blacksmith shop, wood mill, and wooden freight car shop previously used in the manufacturing of wooden cars and which had the capacity of turning out 32 cars a day, will be utilized in the work of steel car constructio

THE TRAGEDY OF OUR GREAT LAKES.

AS we go to press, there are still being unfolded the harrowing details of the greatest combination of disasters that has yet befallen the shipping on the Great Lakes of this continent. Ranking, in recent years, perhaps next to the foundering of the Titanic, 18 months ago, in general importance, but taking premier place and making record so far as Canada is concerned, in the matter of the loss of brave men and things material, we think it meet that reference should be made in the columns of this journal to the overwhelming sorrow which has taken possession of all of us, and to the sympathy we are constrained to extend to those bereaved, because of the untoward, and might we say unpreventable tragedy, in which they have been made participate.

You operative machinist readers are kin to the man on the starting platform at the tank top level, as well as to him who feeds the coal to the boilers, and we somehow feel that in this hour of calamity your pulse beats some faster when you realize that your brother, met his death doing his duty.

And what of the other men, equally faithful, whose duty demanded that exposure to the full fury of the blast on deck and bridge be their shroud!

❖

EPIDEMIC OF BOILER EXPLOSIONS.

CANADA holds the world's record for fire losses per head of population, and if recent happenings are any criterion, she is out to secure the like unenviable reputation in the matter of steam boiler explosions. The latest of these constitutes a shocking record in both life and property, and the wonder of it all is that many more innocent and unsuspecting mortals were not hurled unceremoniously into eternity. The illustrations accompanying the article in another part of this issue give ample evidence of the material devastation wrought by the explosion. The official investigation is still pending, and may, on its conclusion, be expected to give us definite information, as to not only the ultimate, but contributory causes as well, of the disaster.

It should be needless for us to point out here, and in this age of engineering knowledge and practice that this latest or any other explosion is something that did not develop suddenly and then go off. A more or less extended period of probation and preparation preceded the eventuality, and just whether carelessness or want of regular qualified and expert inspection—Government or Insurance Co.,—indifference or negligence of proprietor, carelessness or incompetence of attendant, or an unfortunate combination of two or more of these preceded the explosion, it remains for a searching inquiry to unfold.

The demand for the encouragement and development of higher degree skilled supervision and operation of steam power plants as indicated by the desire for graded certificates is one that cannot be much longer ignored by the authority responsible for the legal enactment of same, and let us say here that the present requirement for an operative engineer's license is one of the most elementary, primary and uncomplimentary valuation of the man's work and possible achievements ever devised. It is, therefore, up to the operative engineer, if he would retain his self respect, to individually and collectively press this graded certificate question in season and out of season to a successful termination, and to actively campaign against the employment of men to operate and attend our steam boilers, who are so palpably ignorant of their work as to be incapable of acquiring the already referred to existent license, and who are a menace to the public at large and to the conservation of our created productive equipments.

We receive letters repeatedly from our subscribers relative to the employment of uncertificated incompetents, and we go on record by saying that such a state of affairs need not and could not exist, if efficient tab were kept by those deputed to attend to this particular feature. Something in the nature of an explosion is necessary we are afraid to both wake-up and shake-up the people interested.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Nov. 17. 1913.—There is little change in general conditions to report this week. Interest has been aroused in the news to hand on the 15th, that Mr. Plummer's mission to England had been successful in raising additional capital. The amount of the new issue is to be $3,500,000 five-year six per cent. secured notes of the Dominion Steel Corporation, due December 1, 1918, the issue price being 97.

The $3,500,000 now being offered is part of an authorized issue of $5,000,000; the balance may be issued at any time by the deposit of additional bonds of the Dominion Iron & Steel Company and the Cumberland Railway and Coal Company. The notes may be retired on any interest date at par on 60 days' notice.

The machinery trade jogs along at the same unexciting gait it has maintained for the past month or two. Dealers are kept fairly busy following up enquiries, but real live orders seem to be rather scarce. In woodworking machinery, however, things seem to be fairly brisk.

Specifications have just been issued by the National Transcontinental Railway Commission for lathes, planers, shapers and drill presses for their roundhouse at Grant, Ont. These are all to be motor-driven tools. The majority of the local machinery houses have not yet submitted their tenders on the equipment called for by the G.T.P. for Prince Rupert, and mentioned in last week's Canadian Machinery. It is likely to be some time before the orders are placed.

Mussens, Ltd., have just received an order for a Brown Hoisting Machinery Co. 15-ton locomotive crane. The purchasers are the Cook Construction Co., who will use it in their work on the new Montreal aqueduct.

Metals.

Trade is quiet in all metals. No further orders are being taken for English and Scotch pig iron, the last shipments of which for this season will be arriving this week.

Contrary to expectations, copper has continued to fall rapidly, the local price for electrolytic and casting copper being quoted at $15.75. New York and London market manipulators are thought to be responsible for this, and producers are said to intend reducing output until the price recovers.

Toronto, Ont., Nov. 18, 1913.—Signs are not very re-assuring in the steel business. Dealers are just beginning to see distinct signs of depression, and expect to feel it in three or four weeks from now, i.e., to feel the absence of orders for steel.

Foreign concerns, who usually leave the Canadian market alone, are coming in now, looking for orders, and their presence is having a disturbing effect on the market. These include American, German, and one English firm. They are mostly firms who want premiums when business is good, and will sell very cheap when business is bad.

Most of the current needs of established engineering concerns were covered several weeks ago, and recent activities of what might be called, spasmodic competitors have shown results more in disturbing existing contracts, than in developing new business. The efforts of Canadian steel concerns, and outside firms who are permanently represented here, are directed towards strengthening the market. Most of them saw this weakening of the market approaching, closed with their customers, so that outside competitors have come into the market to find most of the business closed.

There have been no very important reductions in price this week. There were slight reductions at Pittsburgh, but the only one here is in wood screws, which were dropped 10 per cent. on November 15.

Machine Tools.

The A. R. Williams Co. will move out of their premises on Front St., into the Copp-Clark Building across the way, this week. They have erected and equipped a boiler and blacksmith's shop, two storeys high, on Lake St., which will be used mainly for repair work. They expect to build on the lot between the Queen's Hotel and their present location.

They report collections better this month. The A. R. Williams Co. have found money hard to get, all summer, and particularly in October. November, so far, has been an exceptionally good month, the amount collected already being in excess of that collected in October.

The Canadian Fairbanks Morse Co. did considerable business when they exhibited at the Electrical Exhibition held at the Arena last week. They sold several large electrically-driven machines. Among their orders this week were two for 40 h.p. oil engines, one for Edward Trought, Inglewood, Ont., and another for L. A. Lindsay, Tapperville, Ont., both for grain grinding.

Metals.

No business was done last week in metals. One dealer said he might as well close up and go home. He could see nothing ahead. Orders for scrap iron from big steel companies are away down, indicating that business is slackening down in the steel trade. Prices remain the same.

◆

Ottawa, Ont.—Contracts were awarded last Saturday by the Government to W. H. McGillivray, of Ottawa, for the Geodetic survey adjoining the Dominion Observatory, for $61,948; to the Polson Iron Works, of Toronto, for engines for the Lady-of-the-Lake being built at Sorel, $17,250; the Mergenthraler Co., New York, four linotypes for the Printing Bureau, $14,520; and to the Miehle Printing Press Co., Chicago, through the Toronto Type Foundry, presses, $8,407.

◆

The Pas, Man.—The contract for building the power house has been awarded to Hunter and Dempsey, at $4,000. Work will commence immediately.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Grand Forks, B.C.—The Grand Forks Garage Co. will build a $3,500 garage in the near future.

Virden, Man.—Cook & Doupe, machinists, have leased the business of W. Leverington.

Amherstburg, Ont.—The Amherstburg Garage Co. will build a garage on Dalhousie Street, costing $4,000.

Bradford, Ont.—A plant for making wire screens will be erected here by Watson-Smith Co., Ltd., Toronto.

Wabanum, Alta.—The Hunt Mfg. Co., Walla Walla, Wash., will erect a plant here to manufacture agricultural implements.

Windsor, Ont.—The Remington Arms Co. have given Wells & Gray, Toronto, contract for erecting a second building, costing $50,000.

Quebec, Que.—The C. N. R. shops at Limoilou will probably be considerably extended. Sir Donald Mann was here last week.

Brantford, Ont.—The core room of the Pratt & Letchworth malleable iron plant, which was destroyed by fire in April, has been rebuilt.

Galt, Ont.—The Galt Malleable Iron Co. have opened up two new departments, and will now make aluminum and brass castings.

Moncton, N.B.—It is understood that the Government will extend the I.C.R. car and locomotive shops here, the plant at present being over-taxed.

Sherbrooke, Que.—The Quebec Central Railway is building an engine house extension at Newington, Que. J. H. Walsh, Sherbrooke, general manager.

Mimico, Ont.—The ratepayers will be asked to approve of the action of the council in granting exemption of taxes for ten years to the Augustine Rotary Engine Co.

Winnipeg, Man.—The Winnipeg Ceiling and Roofing Co. have secured the controlling interest in the Edmonton Metal Works, Ltd., Edmonton, Alta., and will enlarge the plant and put in new machines for corrugating iron and other manufacturing work. W. J. Martin, Winnipeg, is president.

City Engineer Currie, of Ottawa, has deducted $680 from the contract price of an incinerator recently erected, owing to a delay of 34 days. The balance due is $7,982.50.

Quebec, Que.—The Eastern Canada Steel and Iron Works, Ltd., who were reported to be contemplating extensions, have decided not to increase their plant just now.

Sumas, B.C.—The plant of the Greene Manufacturing Co. has been sold to Christopher Robinson, a machinist, who has recently installed machinery at the American Mill.

Hamilton, Ont.—The National Steel Car Co., it is said, will start on the erection of an addition to their present plant, for the manufacture of all the interior decorations of steel passenger cars.

Brantford, Ont.—A syndicate has been formed, consisting of Fire Chief D. J. Lewis, Ald. Minshall, and Ald. Hollinrake, to make rotary engines, the invention of Wm. Gunston, of the Cockshutt Plow Co.

New Westminster, B.C.—The Heaps Engineering Co., Ltd., who have spent $37,531 on a new site on Lulu Island, are now negotiating a loan in England for the erection of the plant, which will cost $150,000.

Port Hope, Ont.—The Standard Ideal Co. have recently added four new enameling furnaces, and a second unit in the continuous pouring plant has been installed. A new warehouse has also been built.

Saskatoon, Sask.—Marshalls, Ltd., of Gainsborough, Eng., one of the largest manufacturers of farming implements in Great Britain, last week secured a building permit for an implement factory to cost $94,000.

New Westminster, B.C.—The Vulcan Iron Works, boiler makers, etc., recently received a consignment of ten carloads of sheets and plate from Pittsburgh. They have work for several months in hand. J. L. Duncan, manager.

Montreal, Que.—The Canadian Bronze, Ltd., has been incorporated at Ottawa, with capital of $2,000,000, to manufacture brass, castings, etc. at Montreal. Incorporators: Pearl R. Diamond, general manager, George C. Jones, etc., Montreal.

Gananoque, Ont.—Mitchell & Wilson have the roof on the new building they are erecting for the Ontario Steel Products Co. as an addition to their plant here. The new wing will be used for offices and machine shop.

St. Catharines, Ont.—The Lord and Burnham Co., of New York, makers of sash operating machinery and greenhouse designers, who have agreed to erect a branch factory here, will not have plans prepared until spring.

Montreal, Que.—J. H. Plummer, president of the Dominion Steel & Iron Co., has secured a loan in London of $3,500,000. Part of this will be used, it is said, to double the capacity of the Wabana ore plant in Newfoundland.

Galt, Ont.—B. M. Chittick, manager of the B. F. Sturtevant Co., Galt., says it will not be long before the plant is extended for the manufacture of electric fans and vacuum cleaners. At present only large fans are being made at Galt.

Brantford, Ont.—It is stated that the American Radiator Co. will extend its plant, and move its head office from Brantford to Toronto. W. S. Higgins has arrangements in hand.

Ottawa, Ont.—Instead of spending $50,000 on an extension to The Mint, the Government will take steps towards building a refinery, which will mean a much larger extension.

Sault Ste. Marie, Ont.—The ratepayers have voted to grant a bonus of $20,000 a year, for twenty years, to the Lake Superior Drydock & Shipbuilding Co., who will commence to build the plant on April 1, 1914.

St. Thomas, Ont.—The St. Thomas Bronze Co., Ltd., has been incorporated at Ottawa with capital of $200,000, to manufacture brass castings, etc., at St. Thomas. Incorporators: Pearl R. Diamond, general manager, George Clinton, etc., Montreal.

Vancouver, B.C.—J. O. McFarland, of Vancouver, Henry Hewitt, of Tacoma, Wash. and his son, have gone to Europe to secure capital to construct a blast furnace here or in an adjacent municipality. The Hewitts are said to have secured control of iron ore deposits in British Columbia, and to have arranged for a supply of coking coal. The new company will be capitalized at $15,000,000, it is said.

New Glasgow, N.S.—Robt. E. Harris, president of the Nova Scotia Steel and Coal Co., says that part of the proceeds of the $2,000,000 issue now being placed will be used in equipping a new colliery, a new open hearth furnace, and other plant additions.

Winnipeg, Man.—The North-Western Brass, Ltd., has been incorporated at Ottawa, with capital of $1,000,000, to manufacture brass castings, etc., at Winnipeg. Incorporators: P. R. Diamond, general manager, Darley B. Smith, manager, etc., Montreal.

Montreal, Que.—The Laurie Machinery Co., Ltd., has been incorporated at Ottawa with capital of $25,000, to carry on the business of dealers in machinery and supplies, and manufacturers of machinery, at Montreal. Incorporators: Walter Laurie, machinist, Alvin E. Woodworth, etc., Montreal.

Walkerville, Ont.— The Canadian Bridge Co. are putting in foundations for a 300 foot extension, which will be built next spring. This will be a structural shop for small work. The company will require punches, shears, cranes, etc. They themselves are contractors.

Oshawa, Ont. — The Bowmanville Foundry Co., Bowmanville, Ont., makers of stove trimmings and novelties, nickel and brass plating, etc., who, it was reported, would erect a new plant in Oshawa, will not be able to do so for some time, owing to unforeseen circumstances.

Londonderry, N.S.—Anthony McMillan, of London, and the Eastern Trust Co., of Halifax, have been appointed joint receivers of the Londonderry Iron and Mining Co. The Canada Iron Corporation is the holding Company of the Londonderry Iron and Mining Co., and owns the pipe foundry at Londonderry.

Windsor, Ont.—The Kelsey Wheel Co., a Detroit concern, have just completed a plant, next to that of the Canadian Sirocco Co., and will start operations within a week or two. They will make automobile and other wheels. Their special machinery has been made in the States, but their ordinary machine shop outfit will be purchased in Canada this week.

Electrical

Winnipeg, Man.—The city has secured a contract to supply light to Ward 4, Transcona, for $2,000 a year.

Port Moody, B.C.—The town has awarded a contract to the B. C. Electric Railway Co. for the installation of 30 lights.

Winnipeg, Man. — The Linton-May-Lush Electric Co., Ltd., have been incorporated as electrical engineers, with $20,000 capital.

St. Thomas, Ont.—The Dominion Government will establish an automatic fog horn, to be operated by Hydro-Electric current at Port Stanley.

Rosthern, Sask.—H. E. Shackleton, of Prince Albert, Sask., proposes to establish an electric light plant here if given a site and 10-year franchise. The council have taken a month to think it over.

Niagara Falls, Ont.—A report from Binghampton, N.Y., says that a power plant will be built costing several million dollars, on the Canadian side at Niagara Falls. Surveyors have already been at work, according to reports.

Fort William, Ont.—The Mount McKay and Kakabeka Falls Railway Co. offer to supply 1,000 h.p. to the city at $18 per h.p. The Hydro-Electric Commission offer 1,000 h.p. at $24, with substation and other equipment.

South Vancouver, B.C.—It is planned to build a municipal electric lighting and power plant at a cost of $300,000, and to generate current by steam turbines driven with steam generated in oil burning furnaces. A gas plant is also talked of.

Grenfell, Sask.—The opening of the electric light plant in the town of Grenfell took place on Monday, November 10. The steam engine was supplied by Ruston Proctor & Co., Lincoln, Eng., and the electrical machinery by the Canadian Westinghouse Co., Hamilton.

Victoria, B.C.—Part of the plant of the Vancouver Island Power Co. at Jordan River has been out of commission as a result of the washing away of the grade along which the flume line runs. In the meantime the auxiliary power plants are being operated to capacity.

Smithers, B.C.—Arrangements for the immediate installation of the first unit of the electric light plant have been made by W. J. O'Neill, and his associates. The power-house, work on which will begin at once, will be located on Fourth Avenue. The plant will supply 500 lights, and will be supplemented if not sufficient.

Peterborough, Ont.—The Electrical Power Co. has refused to accept the city's offer of $95,000 for the distribution system of the Peterboro' Light and Power Co., which is controlled by the Electrical Power Co. The city council has therefore, appointed R. A. Ross, of Montreal, as arbitrator in the proceedings which are to follow.

Sandwich, Ont.—The Sandwich town council has asked the Hydro-Electric Commission for information regarding the cost of installing the Hydro system in the town, and what a probable rate would be. Councillor O'Brien thinks that the town will get cheaper power from the Edison Company.

Niagara Falls, Ont.—The building of a suspended raceway to tap one-half of the waterfall from the Canadian Falls and one-half from the American Falls at Niagara River to a point where a power plant will be erected for the generation of electricity is the plan of Frederick Walker, No. 39 Broadway, New York. The raceway will cost about $2,500,000.

Hamilton, Ont.—The Dominion Power and Transmission Co. will build its steam plant to develop 90,000 h.p. near Stewart Park on the bay shore. It is rumored that the company will devote the surplus to operating electric lines, and that it will extend its H. G. & B. line to Niagara Falls, improve its H. & D. line and extend its B. & H. line to Galt.

St. Catharines, Ont.—The city finds 2,000 h.p. Hydro-Electric power insufficient for its needs. A new industry now being negotiated will require 1,000 h.p.

St. John, N.B.—A generating plant with a capacity of 500 h.p. is being installed in the new elevator here; also a small lighting machine of 50 h.p. The W. J. O'Leary Co. are in charge.

Toronto, Ont.—The contracts signed with the Hydro-Electric Commission for power by Owen Sound, Meaford, Thornburg, Markdale, Flesherton and Chatsworth will necessitate the construction of a transmission line to Collingwood, which will cost approximately $500,000. The Government will take the matter up at once, as well as provide money for the development plant at Eugenia Falls.

South Vancouver, B.C.—Electrical Engineer Rawden has urged the municipal council to establish a new system of street lighting. He stated that, with the present system, 100 arc lamps cost $4,500 a year to maintain, while 25 flaming arc lights, he said, would cost approximately $1875 to purchase, and $1,125 a year to maintain. He suggests that as additional lights are needed, 75 arc lights be replaced by 25 or 30 flaming arc lamps, and that the 75 ordinary lamps be distributed where most needed.

General Industrial

Ayr, Ont.—The Sand & Supply Co., a Toronto concern, will make brick at their pit here.

Hull, Ont.—An explosion at the Canada Cement Co.'s works on November 12 did $2,000 damage.

Bracebridge, Ont.—Garrett's tannery here was destroyed by fire last week. Mr. Garrett will rebuild.

Windsor, Ont.—An explosion wrecked the furnace and boiler of D. M. Ferry Seed Co. on November 11.

St. Marys, Ont.—The St. Marys Rock Cement Co. will add three rotary kilns to their plant before next spring.

Victoria, B.C. — Eastern capitalists have invested $300,000 in the soap works of W. J. Pendray & Sons, Ltd.

Ingersoll, Ont.—The Standish Mfg. Co. have awarded the contract for building a soap factory, costing $11,000, to Nagle & Mills, Ingersoll.

Quebec, Que.—G. A. Vandry, France, will take the biscuit factory of John Glass, and operate it if given a bonus by the city. He would employ 50 men.

Medicine Hat, Alta.—The Canada Cement Co. is building a $2,500,000 cement plant at Dauntless, a few miles south of Medicine Hat.

St. Thomas, Ont.—C. H. Caughell, manager of the St. Thomas Gas Co., says $40,000 will be spent on new mains, etc., shortly.

New Westminster, B.C.—Owing to exorbitant rentals, the St. Mongo Cannery Co. will probably move to Steveston, B.C., where a larger plant will be built.

Victoria, B.C.—Sir Wm. Lever has secured a controlling interest in W. J. Pendray & Sons, Ltd., makers of White Swan Soap, and new capital will be used for extensions.

Toronto, Ont.—The Harbor Commission have bought from David Elliott the Elliott Paper Mills property at 23 Fisherman's Island, to permit development work.

Levis, Que.—Efforts are being made to retain the J. B. Blouin & Co. plant for the manufacture of shoes, employing 140 hands, in this town. Inducements are offered by Sherbrooke to go there.

Cobourg, Ont.—H. R. Free's cheese factory at Centreton, near here, was destroyed by fire, November 13, at a loss of $1,500. There is some insurance. Mr. Free owns a circuit of cheese factories.

Bridgeburg, Ont.—The William Briscall Glass Co., who have been maintaining a glass plant in Buffalo, with a smaller plant in Bridgeburg, have decided to consolidate both plants here.

Calgary, Alta.—The Marshall-Izlar Supply Co., a new company who will carry supplies for building, railway, construction and mine development work, have opened offices in the Maclean Building.

Coaticook, Que. — The Barnston Woolen Mills Co. will move their plant here if given certain concessions asked. They will enlarge the plant, and take 40 h.p. electric power, and employ 70 to 80 hands.

St. Catharines, Ont.—The council have endorsed an industrial proposition on which negotiations are taking place. Two by-laws will be introduced shortly to help industries which will employ 200 men.

Transcona, Man.—The D. De Tergene Co. have secured a building permit for a factory to manufacture a preparation for cleaning metal and glass. The contractors, Head, Shannon & Head, have started work on the building.

Rouleau, Sask.—The Medicine Hat Sewer Pipe Co. have purchased an option on three quarter sections of land, the property of Matthew Wallace, two miles north of Rouleau, containing valuable white clay deposits suitable for earthenware pipes.

Victoria, B.C.—J. C. Pendray, managing director of the British American Paint Co., announces the acquisition of new capital which will be used for extensive additions to the plant. Branches will be established at Edmonton and Calgary.

Vancouver, B.C.—A fire, which raged 24 hours and did about $500,000 damage, broke out in the plant of the Imperial Varnish Co., and did damage to the plants of the Hotpin Electric Heat Co., Ontario Lantern and Lamp Co., and Mussens, Ltd.

Cobourg, Ont.—The Cobourg Dyeing Co. have purchased the old Matting and Carpet Company building, and are installing their plant. They will commence operations about April 1, 1914. John E. Hall, East Norwalk, Conn., will be the superintendent.

Toronto, Ont.—Mr. Justice Latchford has granted an order for the winding up of the Superior Portland Cement Co. The application was made on behalf of John McIntyre, a creditor to the extent of $29,260. The head office of the company is in Orangeville, Ont.

Medicine Hat, Alta.—Murdock McLeod, a Moncton, N.B., wholesale clothing manufacturer, has made arrangements to establish a factory to employ 30 hands. He will start the construction of a $10,000 brick building next April, and will manufacture clothing, overalls, hats and caps.

Vancouver, B.C.—The following are individual losses and insurance of firms which suffered by an early morning fire in the heart of Vancouver's business district, on November 16, which it is estimated caused a total loss of about $300,000:—Ontario Lamp and Lantern Co., stock $30,000, insurance $30,000, total loss; Chambers Brothers, stock $6,000, insurance $6,000, total loss; Donkin & Co., stock $15,000, insurance $15,000, total loss; Imperial Varnish Co., stock $40,000, insurance $40,000, total loss; Hot Point Electric Company, stock $10,000, insurance $10,000, total loss; Mussens, Limited, stock $15,000, insurance $15,000, total loss; David Spencer, Limited, stock $45,000, insurance $45,000, loss unknown; Kelly & Douglas, stock in building affected $150,000, insurance $150,000, loss unknown; Gault Bros., stock $300,000, insurance unknown, loss unknown, but mostly caused by water; F. Nicolas & Co., Limited, offices destroyed, insurance unknown, loss unknown.

Building Notes

Todmorden, Ont.—The School Board will erect a school to cost $100,000.

Victoria, B.C.—The Board of Governors of the University will rush work on two new buildings. Sharpe & Thompson are supervising the work.

Vermillion, Alta. — The Dominion Government is building a post office, Customs office and Dominion lands office at a cost of $70,000.

Wood Working

Saskatoon, Sask.—Fire on November 5 destroyed the mill of S. Kerr.

Sault Ste. Marie, Ont.—The Andrews Lumber Co., Ltd., are building several mills near here.

Toronto, Ont.—The Beverley Wood Specialty Co., Niagara St., will build a woodworking factory.

Wigwam, B.C.—The Lee Lumber Co. sawmill was burned October 30. The loss was about $30,000.

Victoria, B.C.—The Empire Lumber Co., a concern already established on Vancouver Island, proposes next year to construct a new mill at Osborne Bay, near Crofton. Vice-president C. C.

Young, of New York, announces that this new mill will be equal in capacity to the largest existing mill on the Pacific Coast. The company says the capacity of the new mill will be 250,000 feet daily.

Wyoming, Ont.—A sawmill will be built in connection with the box and basket factory being erected here by Dan Senecal.

Stoney Creek, Ont.—The Parry Sound Basket & Veneer Co. will erect a factory here for the manufacture of boxes, crates, etc.

Scott Junction, Que.—The Beauce Pulp & Lumber Co., Quebec, are considering plans for a new mill, to replace one destroyed by fire.

Rossland, B.C.—Mayor J. S. Deschamps will operate a mill at China Creek for two years on timber he owns in that vicinity.

Montreal, Que.—Fire broke out in the paint shop of the Dominion Iron Bound Box Co. plant on November 11, and did $3,000 damage.

New Westminster, B.C.—Mr. Darling, Industrial Commissioner, has secured a firm of American shingle manufacturers, who will build a large plant here.

Victoria, B.C.—Extensions to the mill of James Leigh & Sons, David Street, are contemplated, costing $6,000. The permit for the structure has been issued.

Hespeler, Ont.—The town is negotiating with T. Gettwalls, Grand Rapids, Mich., for the establishment of a plant for the manufacture of office fixtures and furniture.

Brantford, Ont.—The Reach Co., of Philadelphia, makers of sporting goods, are erecting a plant here, and the Spalding Co. may also erect a plant in Brantford for the same purpose.

Victoria, B.C.—Fire at Cumberland on November 14 in No. 8 mine of the Canadian Collieries, Mackenzie & Mann, caused a loss estimated at $40,000. The mill and machinery were a total loss.

Contracts Awarded

Hamilton, Ont.—The city has awarded a contract cable, amounting to $53,764, to the Standard Underground Cable Co.

Vancouver, B.C.—The Mannesmann Tube Co., of London, England, recently supplied the city with 80,000 feet of steel pipe.

Ottawa, Ont.—Tenders have been let for the new Government elevators at Moose Jaw and Saskatoon, and work is being rushed.

Hanley, Sask.—A contract has been awarded to the British Canadian Engineering and Supply Co. for a producer gas electric plant.

Niagara Falls, Ont.—The Hydro-Electric Commission has awarded the contract for an extension to their power house at Falls View to Wells & Gray, Toronto, for $7,000.

Toronto, Ont.—Chambers, McCaffrey and McGuigan, of Toronto, were awarded by the Cabinet Council last week, the contract for the construction of the Nassau dam on the Trent Canal. The contract price was $72,768.

Sarnia, Ont.—The Forest City Steel and Iron Co., Cleveland, Ohio, have received the contract for steel work for the new factory building, 180 x 280 ft., to be erected by the Perfection Stove Co. at Sarnia.

Estevan, Sask.—The town is adding to its plant two Babcock & Wilcox boilers fitted with Dutch oven furnaces for burning low class lignite mined in this district; also one compound quick revolution forced lubrication Goldie & McCulloch engine driving a Westinghouse alternator and exciter.

Winnipeg, Man.—The city engineer's department has been authorized by the Board of Control to purchase a centrifugal pump to raise the sewage from the low level of the McPhillips Street sewer at Aberdeen Avenue so that it will empty into the trunk sewer at Polson Avenue. The pump will be supplied by the Canadian Fairbanks-Morse Co. at a cost of $832.

Tenders

Yorkton, Sask.—Tenders are called up to December 22 for the supply of one 500 b.h.p. gas-electric unit.

Three Rivers, Que.—Tenders have been called by the city for the construction of a new ferry boat to ply between the city and the south shore.

Winnipeg, Man.—Tenders addressed to the Chairman, Board of Control, will be received up to November 21 for the supply and delivery of one 500 k.w. motor generator set for the King Street substation. M. Peterson, secretary.

Winnipeg, Man.—Tenders addressed to the Chairman, Board of Control, will be received up to November 25th for the manufacture and delivery of a quantity of weatherproof insulated copper wire. M. Peterson, secretary.

Ottawa, Ont.—Tenders for steel wire rope (tenders due December 1), steel and iron bars, sheets, plates and angles (tenders due December 3), copper and brass bars, sheets and tubes (tenders due December 15), will be received by C. J. Desbarats, Deputy Minister of Marine and Fisheries. Stores to be delivered at H.M.C. Dockyards at Halifax and Esquimault, B.C.

Ottawa, Ont.—The City Council will call for new tenders for building a hypochlorite station on Lemieux Island. Eight tenders for supplying hydrants were received, an dthe city engineer will choose the best.

Winnipeg, Man.—Tenders, addressed to the Chairman, Board of Control, will be received up to December 15th for the supply of two h.p. motor hose wagons, and a 75 h.p. motor aerial ladder truck. M. Peterson, secretary.

Victoria, B.C.—Tenders are now being called by the Dominion Government, to be in before the end of the year, for two piers, to be located between the Rithet pier and the breakwater. They will be 250 feet wide and about 800 feet in length.

Vancouver, B.C.—J. J. Warren, president of the Kettle Valley Railway, opened tenders on November 6 for the construction of the last stretch of the Kettle Valley. The distance to be finished is about 60 miles, west of Osprey Lake.

Ottawa, Ont.—Tenders will be received up till January 7th, 1914, for the construction of six 200-ton mechanical coaling plants with sandhouses complete at points on the National Transcontinental Railway. Plans and specifications may be obtained from W. J. Press, mechanical engineer, Ottawa, Ont. P. E. Ryan, Esq., secretary of the Commissioners of the Transcontinental Railway.

New Incorporations

Atlantic Oilfields, Ltd., incorporated at Ottawa, capital $600,000, to prospect for oil, etc., at Fredericton, N.B. Incorporators—Albert J. Gregory, John J. F. Winslow, etc., Fredericton.

Breslau Wood Products Co., Ltd., incorporated at Toronto, capital $25,000, to manufacture and sell furniture, at Breslau, Ont. Incorporators—James H. Dixon, Edmund H. Dedels, etc., Waterloo.

Fisher Motor Co., Ltd., incorporated at Ottawa, capital $600,000, to manufacture automobiles at Walkerville, Ont. Incorporators—Charles F. Garaghty, Detroit, Mich.; Frank Edgar Fisher, etc., Walkerville.

The Reid-Donald Steamship Co., Ltd., incorporated at Ottawa, capital $100,000, to deal in ships, vessels, etc., at Montreal. Incorporators—Walter R. L. Shanks, Francis G. Bush, etc., Montreal.

Vaudreuil Electric Co., Ltd., incorporated at Ottawa, capital $50,000, to carry on the business of an electric light, heat and power company at Vaudreuil Station, Que. Incorporators—Daniel P. Gillmor, Francis G. Bush, etc., Montreal.

Canadian Water Purifying Co., Ltd., incorporated at Ottawa, capital $40,000, to manufacture and deal in mining, milling, filters and general machinery at Montreal. Incorporators—Louis A. David, Louis J. M. Dugas, etc., Montreal.

Glengarry Construction Co., Ltd., incorporated at Ottawa, capital $100,000, to build and construct railways, canals, telegraph, telephone and electric power transmission lines at Montreal. Incorporators—Charles A. Pope, Gregor Barclay, etc., Montreal.

Municipal

Raymond, Alta.—The town will enlarge its reservoir next spring.

Mimico, Ont.—Carl Grobba is extending his waterworks which supply the town.

Nelson, B.C.—Ratepayers have voted in favor of purchasing the Nelson Gas Co. plant.

Brockville, Ont.—The municipal gas plant will be extended by the installation of new retorts.

Montreal South, Que.—The town council is considering a water and drainage system. Mayor Smillie.

Aylmer, Ont.—The waterworks and electric light department is in the market for a Duplex steam pump.

Swift Current, Sask.—The ratepayers will be asked to vote $15,000 for the installation of a fire alarm system.

London, Ont.—The present equipment of the London incinerator will have to be increased shortly.

Stratford, Ont.—The by-law to guarantee the bonds of the Avon Hosiery Co., which was defeated, will be re- ubmitted.

Port Arthur, Ont.—On advice of T. Aird Murray, the treatment plant of the new sewage system will be put in the south-west end of the city, and a pumping station will also be established. The expenditure will amount to $250,000.

Toronto, Ont.—A new water supply costing $100,000 is planned, and six miles of 6, 8, 12, and 16 inch mains will be required.

Galt, Ont.—The city will construct a large reservoir at the pumping station, and will require stand pipe and new mains.

Castor, Alta.—The ratepayers have voted $20,000 towards the completion of a gas well and extension to the gas lighting system.

St. Boniface, Man.—The ratepayers, on November 5, carried a by-law for $300,000 for sewer construction, and another for $50,000 for waterworks extensions.

Humboldt, Sask.—By-laws providing $103,547 for a waterworks system, $57,700 for sewerage, and $20,500 for extensions to electric light system, have been prepared.

Stamford, Ont.—The Jenckes Machine Co., St. Catharines, offer the council a standpipe without cement base, 16 ft. diam., and 80 ft. high, for $4,500. The town is installing a waterworks system.

Edmonton, Alta.—City Engineer Latornel has advised that both sides of the High Level Bridge passenger deck be wired at a cost of $4,000, with 1¾ inch galvanized iron netting.

Regina, Sask.—The Canadian West Natural Gas Co., represented by T. A. McAulay, has offered to supply natural gas in three years at 25 cents for power and 40 cents for domestic use.

Winnipeg, Man.—Representatives of the American Well Works of Aurora, Ill., A. W. McLean and Geo. W. Igo, were here November 13, in connection with the contract for the supply of a pump for some of the city wells.

Montreal, Que.—Fire Chief Tremblay reports that the new fire hall at 25 Drummond Street will be ready in the early spring. The city will equip this hall with a motor engine of 12,000 gallons pumping capacity; one hose waggon, and one ladder truck, costing $28,000.

Winnipeg, Man.—Surveying for the Greater Winnipeg water project has started, and as soon as the rights-of-way have been secured, a telephone line will be installed between Winnipeg and Shoal Lake. Actual construction will be begun next spring.

Ottawa, Ont.—It is probable that at the January elections Ottawa will vote on a proposal to establish a municipal gas plant. A special report presented to the council shows that the city can supply gas for 85 cents per thousand feet, as against $1.10 now being charged.

Refrigeration

Markham, Ont.—F. T. Newton has purchased a site for an abattoir.

Ottawa, Ont.—The ratepayers will vote on a civic abattoir proposition.

Lennoxville, Que.—Messrs. H. P. Hooper & Sons, of Boston, Mass., are contemplating the erection in Lennoxville of an up-to-date butter making plant and cold storage.

Quebec, Que.—The recently formed Quebec Abattoir Co. will build next spring. Representatives of the company are visiting other plants, getting suggestions. The company have decided to go into the canning business.

New Westminster, B.C.—The B. C. Packers' Association have informed the City Council that they do not wish to move the Columbia Cold Storage Co.'s plant to Steveston, B.C., but must be granted facilities by the city for erecting a new plant at once.

New Westminster, B.C.—Tenders for building a plant, to cost altogether $200,000, have been called by the Columbia Cold Storage Co., New Westminster, who will build their new plant in Steveston, B.C. The tenders received vary from $70,000 to $174,500.

Railways - Bridges

Steelton, Ont. — The International Transit Co., Sault Ste. Marie, are building a street railway here.

Quebec, Que.—The City Council has given the Champlain Realty and Elevator Co., who will build a passenger elevator from Mountain Hill to Frontenac Park, a 25-year franchise.

Ottawa, Ont.—The city and the Ottawa Electric Railway Co. will rebuild the bridge on Broad Street at a cost of $200,000. City Engineer Currie says it will be of reinforced concrete construction.

St. John, N.B.—H. M. Hopper, general manager of the street railway, announces that an agreement has been reached between the council of the parish of Simonds and the company, and that the car line will be extended to Crouchville before July 1, 1914, and later to Little River.

Ottawa, Ont.—E. E. Malone, chief engineer of the Ottawa and St. Lawrence Electric Railway, will build a double track line from Ottawa to the new Connaught Rifle Ranges, beginning next May.

Welland, Ont.—It is said that the Imperial Traction line, a proposed trolley route from Smithsville, Ont., to Bridgeburg, via Hamilton, which was supposed to have been started last May, will be started in the early spring.

Vancouver, B.C.—Sir Richard McBride, while in England, discussed Second Narrows Bridge with Sir John Wolfe Barry, the eminent bridge engineer, and several proposals will be considered by the Provincial Executive.

Victoria, B.C.—A committee composed of Aldermen Cuthbert, Porter, Meston and the city engineer, has been appointed by the City Council to inquire into the question of what shall be done to improve the present Rock Bay Bridge, or remove the present structure and replace it with a new and better arranged structure.

Regina, Sask.—Application will be made to the Provincial Legislature for the incorporation of a company, to be known as the Central Saskatchewan Railway Co., with headquarters in Regina, and branches to Saskatoon, Prince Albert, and the Manitoba boundary. The new railway will start with about 700 miles of road, divided among four branches, three of which will radiate from Regina. P. M. Anderson is solicitor for the Company.

Vancouver, B.C.—The contract for the work along the Coquahalla summit of the Kettle Valley Railway, of which J. J. Warren is president, has been let to Messrs. Armstrong & Morrison. This contract includes the boring of twelve tunnels and also a bridge across the Fraser River at Hope, giving connection with the C.P.R. at that point. It is estimated that the contract will run up to as much as $100,000 a mile in places.

Marine

Quebec, Que.—The transfer of the Quebec Steamship Co. to the R. and O. interests is expected to take place shortly.

Halifax, N.S.—Hon Robt. Rogers, Minister of Public Works, announces that the largest dry dock in the British Empire will be built on Halifax Harbor, probably on the Dartmouth side. He also states that he will give his support to the construction of a bridge across the Narrows, connecting Halifax and Dartmouth.

London, Ont.—Ald. Frank White and Fire Chief Aitken have been appointed a committee to purchase a steel boat for the fire department.

Ottawa, Ont.—The new ice breaker, for which tenders will be called in a few days by the Marine Department, will be the largest in the world It will be used on the St. Lawrence.

Collingwood, Ont.—The new steamer for the Pelee Island mainland route will be launched in Collingwood in December. She will have a speed of 15 miles an hour and will cost $70,000.

Welland, Ont.—M. Beatty & Sons have been awarded the contract to build a large dipper dredge for the C. S. Boone Dredging and Construction Co. of Toronto. The dredge, when completed, will be used on the excavation work of the new Welland Canal. It will be of five yard capacity, 100 feet long, 50 feet wide, and ten feet in depth, and will be of steel construction.

Collingwood, Ont.—According to A. A. Wright, general manager of the St. Lawrence and Chicago Steam Navigation Co., the new sister ship to the ill fated James Carruthers, which was lost on Lake Huron recently, should be ready to be placed in commission in time for the grain-carrying trade next autumn. The loss of the Carruthers is covered by insurance to the extent of $275,000 with the underwriters, and $150,000 in the insurance fund of the Company.

Trade Gossip

Moose Jaw, Sask. is is need of a city engineer. Applications should be sent to E. B. Bonnell, city clerk.

The Canadian Wire Co., Montreal, have changed their name to that of the Colonial Wire Mfg. Co., Ltd.

The Dominion Steel & Iron Co. expect to finish their new hospital at Sydney, N.S., by the first of the year. It will accommodate 50 patients.

The Auto Wheels, Ltd., London, Eng., will apply to the Parliament of Canada for an Act reviving the patent and extending the time within which they may commence to construct or manufacture in Canada the inventions patented under the same.

Foundry Convention and Exhibition.—We have received official intimation that the Conventions of the American Foundrymen's Association, The American Institute of Metals and The Associated Foundry Foremen, will be held simultaneously with the Exhibit of the Foundry & Machine Exhibition Co. in Chicago, from September 7th to 12th inclusive, 1914.

Siemens Co. of Canada, Ltd., announce that one of the Siemens Companies has supplied eight 150 k.w. sets, four per vessel, to the C. P. R. Steamships "Empress of Russia" and "Empress of Asia." The sets in question are driven by Belliss & Morcom engines. The Siemens Co. have also secured the contract for the electrical equipment for two further C.P.R. steamships now being built on the Clyde, by Barclay, Curle & Co., the generating sets in this case being six 100 k.w. and two of 16 k.w.

Personal

Vancouver, B.C., is advertising for an assistant waterworks engineer at a salary of $4,000.

F. C. Martin has been appointed superintendent of North Battleford, Sask., electric light plant.

J. A. Tilden, a machinery manufacturer from Boston, Mass., arrived in Vancouver last week on a business trip.

M. Rundlett, for almost two years Engineering Commissioner in Moose Jaw, has resigned his $6,000 a year position.

Robert Reford, of Montreal, the well-known shipowner who died March 15 last, left an estate of $2,912,486.

J. H. Hopp, formerly Canadian manager for Chas. W. Kawin, chemists and metallurgists, Toronto, is again in charge of the Canadian office.

Geo. Wedlake, superintendent of the Cockshutt Plow Co., Brantford, is mentioned in connection with the appointment of a Hydro-Electric Commission.

J. H. Bunting, joint manager of Bruce, Peebles & Co., electrical engineers, Edinburgh, Scotland, has been on a business visit to Montreal.

B. S. Foss, of Boston, president of the B. F. Sturtevant Co.; E. B. Freeman, secretary; and E. Elliott, Montreal sales agent, were recently in Galt, looking over the plant there.

A. T. Shortt, superintendent of the C.P.R. shops at Ogden, Alta., who has been laid up with an attack of appendicitis, has recovered and returned to his duties.

T. W. Kirby, of the Hamilton Stove and Heater Co., Hamilton, will move to Almonte, Ont., permanently this week, to take charge of the new Kir-Benn, Ltd., plant.

Save Your Time ! !

Time is the business man's most important asset, and to get the most out of a given amount of time his problem.

The many demands made upon his time makes it difficult for him to keep posted upon momentous questions and national happenings. This raises another problem—

What shall the business man read ?

Of magazines there are no end,—fiction magazines, technical magazines, professional magazines, each elbowing its way to the reader's notice. Very entertaining or instructive or educative the respective classes may be, but the magazine that combines all of these qualities, that fills the requirements of a broad, high-class, periodical for the business man's library, is unique. Canada has such a publication in MacLean's Magazine.

It differs entirely from any other Magazine. Technically it should not be called a Magazine. It is a high-grade national monthly newspaper. It aims to publish the latest information from the pens of the best available writers of the Political, Social and Business development in Canada and throughout the world. It is just what is needed to fit with the business man's hobbies and keep bright the culture of his information.

The fiction also from the strongest Canadian writers is so select that the busy man can afford the time he thus spends fascinated by the lure of romance and adventure. Lastly, such a budget of literature meets the demand of the business man's home in that it is an educative, sterling, broad-minded oracle for the family circle.

Secure a copy from your nearest newsdealer. You'll enjoy its pages from cover to cover. Take a copy home to-day—The price is twenty cents.

The MacLean Publishing Co.
Limited
143 University Avenue, TORONTO, Canada

W. U. Bennett, vice-president of the Gramm Motor Truck Co. of Canada, Ltd., Walkerville, Ont., visited Winnipeg last week for the first time in twenty-three years. Needless to say he found a change.

H. J. Fuller, President of the Canadian Fairbanks-Morse Co., addressed the Science Undergraduate Society of McGill University, Montreal, on Wednesday, November 12, taking for his subject, "The Engineering Salesman."

J. W. Porter, who has been appointed by the Government to succeed John Armstrong as chief engineer of the Hudson Bay Railway, was originally employed by the C.P.R., but for some years and up to the present time has been engineer in charge of District B of the Transcontinental Railway, in Quebec City district.

John Armstrong, chief engineer of construction for the Hudson Bay Railway, has placed his resignation in the hands of the Government, who have accepted it. He has been in charge of the work for several years, and it is upon his reports and upon surveys conducted under his supervision that the route has been chosen to the Bay. He will do subcontracting for the line.

Book Reviews

The Bureau of Mines, of the Department of the Interior of the U. S. Government, Washington, has published a Miners' Circular No. 8 and entitled "First Aid Instructions for Miners." The descriptive matter is accompanied by a number of photographs showing methods of applying bandages, etc.

Quality Hack Saw Blades

Cut Faster and Last Longer

This will minimize your stops to replace blades and thus save you much valuable time.

They will increase your output.

"Quality" blades are guaranteed in every respect. If you have any complaint we will replace same or refund your money.

4 St. Antoine St., MONTREAL, Canada

Some Advertising Advice.

¶ To make your advertising help your business, you must make it your business to help your advertising.

¶ Fancy a salesman calling on a very busy man once a week for a year, and saying exactly the same thing, wearing the same clothes and the same expression. Wouldn't he stand a fat chance of doing business? And yet there are men who will condemn advertising because it can't produce results under conditions which would be absolutely intolerable in the human salesman.

¶ You may not have the artistic ability to plan attractive layouts for your advertisements—few business men have — but you can say something about your line that no other man can say. Something that rings true, something convincing—something that will sell.

¶ Leave the planning of your ad. to our service department. Tell us what you want to say and put it up to our ad-writing department to dress it up for the occasion—effectively.

¶ Our ad-planning-writing service is second to none in Canada, and many of our most successful advertisers are taking advantage of it. Its services are free, and every advertiser or prospective advertiser in this publication is invited to employ its help.

¶ Remember this—cold type and illustration are representing your product — your house—your service. If the illustrations are poor, if your message is weak, the type arrangement unattractive, a poor impression is received by the readers of your advertisement. On the other hand, good illustrations, good copy and a good layout give a good impression.

¶ You can't afford to allow a poor advertisement to represent you, when our Service Department stands ready to help you.

¶ **If you want your advertising to make good, you've got to make it good.**

¶ And it **will** make good in Canadian Machinery if **you'll** do **your** share. **We're** prepared to do **ours.**

W. H. BANFIELD & SONS
120 Adelaide St. W., Toronto

The Bureau of Mines, Department of the Interior, Washington, has published Technical Paper No. 41 which deals with the mining and treatment of lead and zinc ores in the Joplin district, Missouri.

The Bureau of Mines, Department of the Interior, Washington, has published bulletin No. 50 entitled "A Laboratory study of the Inflammability of Coal Dust." The bulletin contains much valuable information on the subject of coal dust, with tables of chemical analysis of coals, and a large number of curves showing the relative inflammability of various coals mined in the United States.

The Department of the Naval Service, Ottawa, has published a bulletin entitled "The currents at the entrance to the St. Lawrence." The bulletin contains the results of observations taken in recent years, principally during the seasons of 1911 and 1912, of the strength and direction of currents in the Gulf of St. Lawrence. Stations were established at various points, and the readings taken form the subject matter for four tables and a map, in addition to a description of the work accomplished.

The Livingstone Way, by John Livingstone. Published by John Fortier, Ltd., Montreal, P.Q. Price, $2.00. This book has been written with the idea of creating a general interest in the questions of smoke prevention and boiler explosions. The author, to explain his point, has collected a considerable amount of matter from the daily press and other sources, which consist principally of abbreviated accounts of accidents on land and sea through boiler explosions. The bad effects of smoke on people and structures, and the economical aspect of smoke prevention are dealt with in a similar manner. The problems treated are, of course, not new ones, but the matter contained in this book should help the reader to realize the great waste in life and property, each year, which might to a large extent be prevented if reasonable care and proper precautions were exercised.

Elwell-Parker Electric Truck used at the Altoona Shops, Pennsylvania Lines.

The New Economical Way of Handling Material in Your Plant

Possibly it has not occurred to you that there is a more economical and efficient way of moving material about your plant than by means of the over-head carrying system?

Many industrial plants find the self-propelled, high capacity truck much more economical both in original cost and maintenance, and far more flexible than the old overhead trolley system.

ELWELL-PARKER ELECTRIC TRUCKS

Wherever used have shown an actual saving of from 25 to 65 per cent. both for railroads and industrial concerns. One large Canadian Plant trying electric trucks for the first time claims that each truck, operated by one man, has replaced eight men with eight wheelbarrows.

Elwell-Parker Electric Trucks are equipped with Edison Storage Batteries, which are recognized to be about the best on the market.

Elwell-Parker Trucks are extremely easy of operation, in no way requiring skilled labor, and by having a spare battery set can be worked overtime continuously without injury.

If you are extending or rebuilding your plant it will pay you to investigate this well-known truck.

Ask for Bulletin 107.

Meets Requirements For Heavy Service

What do you expect in any machine designed for heavy manufacturing service?

Above all, ample power and a consistently rigid design.

Note how well these points have been taken care of in the No. 5B Heavy Plain Milling Machine.

Large diameter constant speed drive pulley running at high speed carries an extra wide belt. The over-head pulley is also of large diameter, giving wide belt contact and powerful driving leverage. The variable feed, by means of hardened spur gears, is driven by chain direct, mounted on large diameter hardened steel shafts, firmly supported. Result,—elimination of vibration and maximum efficiency.

The knee slide extends to the top of the frame, stiffening the column and forming a massive housing for the spindle. Notice the long bearing of the knee on the column. Stout transverse ribs give rigidity for heavy service.

The table is heavy and has a vertical depth that gives the necessary stiffness to prevent springing under deep cuts. The depth of the saddle and extra long bearings in proportion to the length of the table are clearly shown.

Stout, easily adjustable braces serve to firmly lock the knee and overhanging arm together, resisting the stresses that tend to produce vibration.

If you have heavy milling, these features should interest you.

THE ONLY ABSOLUTELY FIREPROOF MALLEABLE PLANT IN CANADA

CASTINGS

High Grade Malleable Iron Castings

CAPACITY OF 5000 TONS

Let Us Quote Prices

CANADIAN MALLEABLE IRON CO. LTD.

OWEN SOUND, ONT.

CASTINGS

ALL CASTINGS GUARANTEED TO YOUR APPROVAL

STEEL CASTINGS

All Sizes, ¼ lb. to 30,000 lbs.

We make **New Process Converter Steel Castings, annealed and unannealed:** also **Chrome-Manganese and Nickel Steel Castings.**

Our Castings are perfect, yet they can be procured at a price that will ensure economy.

Every one guaranteed.

Ask us for estimates.

Casting for a 10,500 H.P. Water Wheel

JOLIETTE STEEL CASTINGS WORKS, Limited

Head Office and Foundry: JOLIETTE, P.Q.

THE

Steel Company of Canada

LIMITED

PRODUCERS OF

PIG IRON

Foundry Basic Malleable

Bar Iron **Bar Steel**

Plain Bars and Twisted Squares for reinforcement of Concrete

Bolts and Nuts, Tacks, Screws, Wire Nails, Rivets, Wire

Immediate Shipment all Standard Sizes

Prompt Attention to Orders for Special Sizes

Wrought Pipe, Bale Ties, Lead, R. R. Track Equipment, Field Fencing

BLOWER DEPT:

A Valuable New Book on an Important Trade

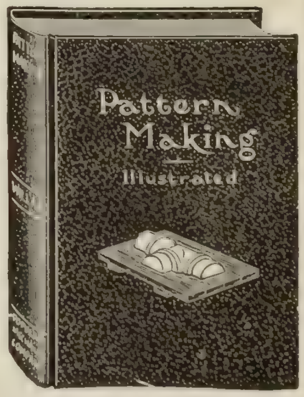
PATTERN-MAKING
By G. H. WILLARD

Two Significant Opinions:

"I think the book is the best I ever saw for the price." Edwin Sluyter, Construction Engineer, Burroughs Adding Machine Co., Detroit.

"I consider this is a valuable book and should be in the hands of all men engaged in this line of business." E. W. Clarke, Wilmington Malleable Iron Co., Wilmington, Delaware.

224 Pages. 312 Illustrations. Cloth Cover.



With Additional Chapters on Core-Making and Molding

"WRITTEN SO YOU CAN UNDERSTAND IT."

A book for the man who does the work. Written by a practical patternmaker of many years' experience. Gets right down to business in the first chapter and keeps it up throughout the book. Full of kinks and actual working information. Profusely illustrated.

Chapter Headings

I. Pattern-Making as a Trade. II. The Tools. III. Woods. IV. Joints. V. Turning. VI. Turning (Continued). VII. Turning (Continued). VIII. Turning (Concluded). IX. The Circular Saw. X. The Circular Saw (Continued). XI. Machine Tools. XII. Machine Tools (Continued). XIII. Simple Patterns. XIV. Simple Patterns (Continued). XV. Simple Patterns (Concluded). XVI. Crooked Patterns. XVII. Large Pattern Work. XVIII. Large Pattern Work (Continued). XIX. Crosshead Guide Patterns. XX. Sweep Work. XXI. Pipe Work. XXII. Stove Pattern Work. XXIII. Molding—Machine Work. XXIV. Molding Pattern Work.

Part II.—Core-Making and Molding.

Chapter I. Core-Making, Simple and Complex. II. Principles in Molding. III. Loam Patterns and Loam Molds. Everyone following this trade, or intending to learn it, should have a copy of this valuable book.

Price $1.10 Postpaid

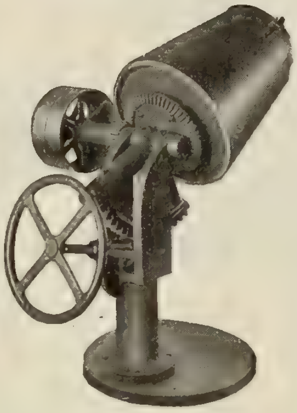
Watch Your Tumbling Costs Tumble

DOWN goes your tumbling expenses—and up goes your profit. The high cost of tumbling is now an unnecessary evil—for you can get better work with a big, all around saving in time, labor and floor space by using



Globe Tumbling Barrels

One Globe Barrel will handle a wider range of work than two or three of your ordinary horizontal barrels. When gentle or violent tumbling is wanted you simply shift the running angle of the barrel. The work may be inspected while the barrel is running. You don't even have to stop a Globe Barrel to fill or empty it.

Now these are big features in themselves—but the real advantage of Globe Barrels is the fact that they tumble the work right and give you a clean, smooth, finely finished lot of parts.

8 stock sizes—$50 to $170

Your catalog file isn't complete unless it contains our booklet No. 2. We'll send this to you free if you'll write us.

THE GLOBE MACHINE & STAMPING CO.

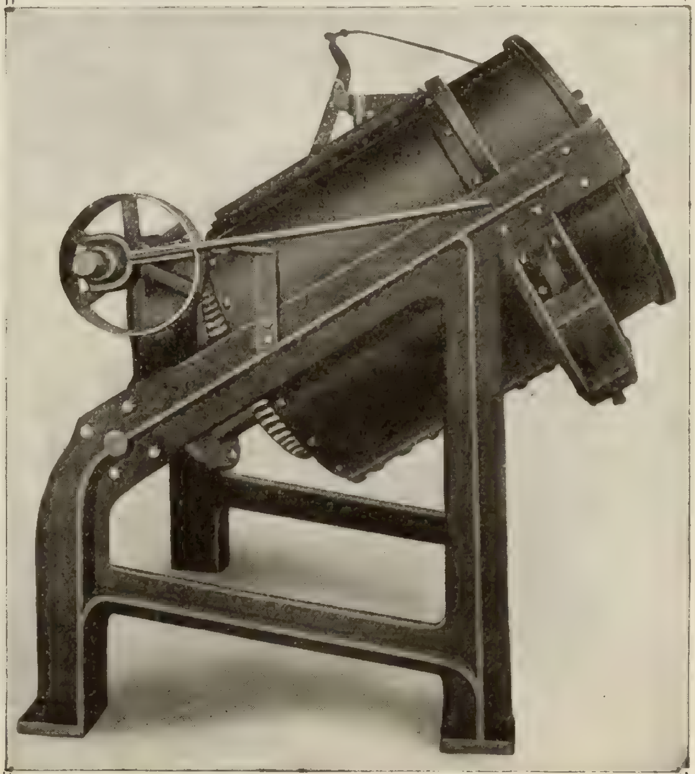
WHITING
FOUNDRY EQUIPMENT CO.
HARVEY-ILL. U.S.A.
CHICAGO SUBURB.

Pipe Steel (O. H. and Converter) and Malleable

The "No-Wear" Nozzle

An exclusive feature of the "Sly" and Satisfaction



And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

TRADE MARK

RAILROAD SPECIAL
W&B

"W & B Railroad Special" Wrenches are unusually strong. The design is plain, construction substantial, and only tested steel is used, assuring great strength, durability and "grip." Threads do not strip or jaws chip off on "W & B" Railroad Wrenches. Both head and bar are drop forged in one piece, jaws are case hardened.

A full guarantee goes with every "W & B" Wrench, High Speed Steel Drill or other small tool. We build the most complete line of small tools manufactured under one trade mark—"W & B."

Girder Radials

MANUFACTURED BY WILLIAM ASQUITH, LIMITED

For Structural, Boiler, Ship and Other Plate Drilling and Railway Car Work, &c.

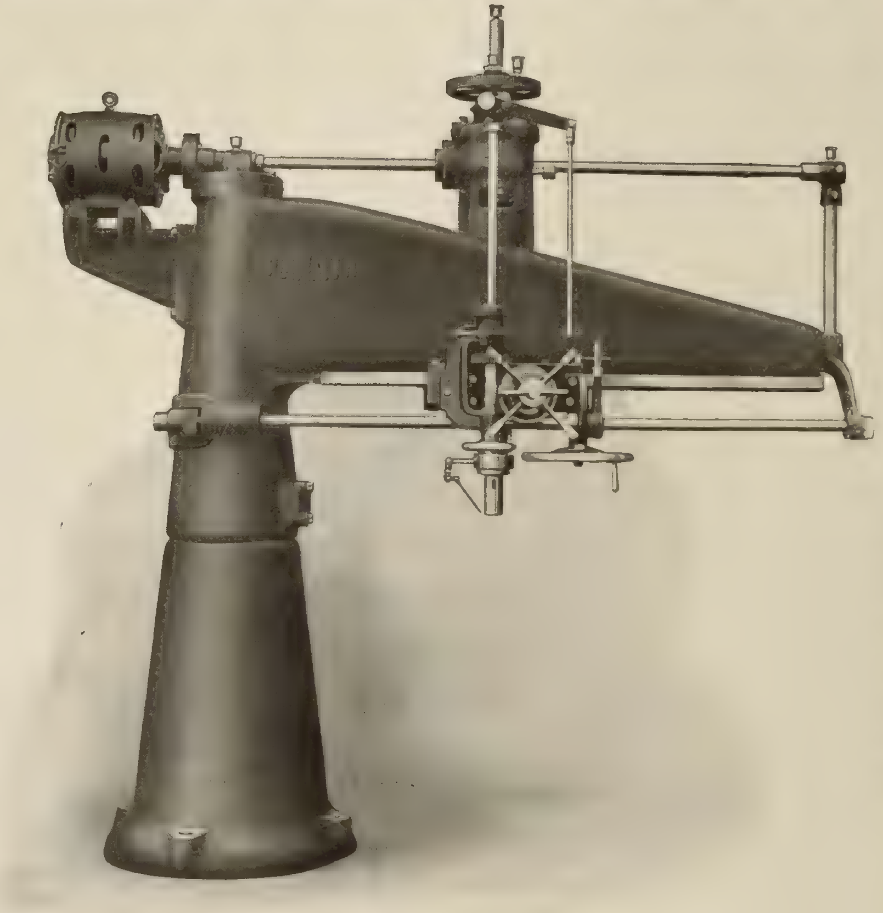
Drilling Capacity is the Maximum;

Economy in use of Twist Drills.

Easy and Rapid Handling.

Locking Motion for Arm is Operated from the Saddle.

Durability, Every Part Designed to be up to its work.



SIX FOOT CENTRAL THRUST GIRDER RADIAL DRILLING MACHINE WITH INDEPENDENT MOTOR DRIVE

The Spindle is Patent Central Thrust.

Small Actual Floor Space.

Arm Swings Full Circle.

Motor Occupies no Floor Space. Fixed on Arm and Swings with Machine.

Made in Batteries on Trucks or any way to suit your Requirements.

The Use of This Manufacturing Equipment Effects an Increase in Output of 50 to 150 per cent.

Made in Four sizes, 6 ft., 7 ft., 8 ft., 9 ft.

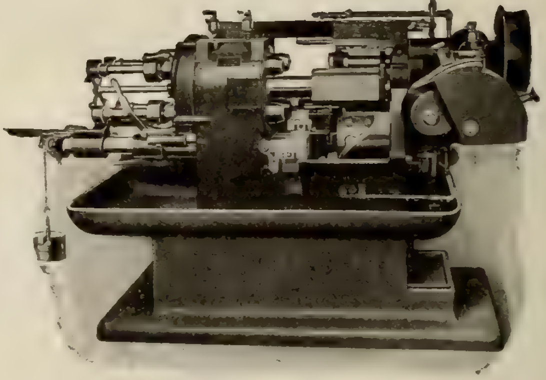
A Rigid Line of Steel



"Gridley" Multiple Spindle.

holds the relation between the cutting tools and the spindles, constant and unvarying.

In other types of machines, with the old-fashioned method of securing tools by the shank, any side play in the bearings of the spindle carriers means **a variation in the size and a loss of accuracy in the finished product.**

But in

Gridley Multiple Spindle Automatics

spindle carriers and tool holders form a **unit.** Any play in the carrier bearings has no effect whatever on the relation of cutting edges and stock.

Then again, the special "Gridley" Turret, horizontal and supporting the tools right under their cutting edges, speeds up production, and yet maintains that invariable accuracy.

Do you know about the feature that allows the operator to find the limiting feeds the tools will stand, **after** he's completed the camming?

"Gridley Automatics" tells you. Write for it.

Rockford Drilling Machines

Greatly
Increase
Production

Rockford Gang Drills are really vertical lathes, but their value is in their ability to use the operator's time to the greatest advantage. With this machine in your shop the operator will have no idle moments, but will be turning out more work and increasing your profits.

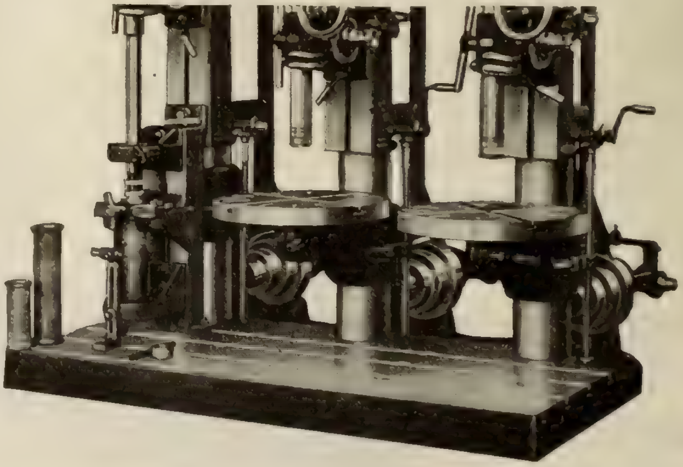
By proper Jigging and Tooling of the machine, gauging the number of spindles per operator to the time required for the longest operation, and in the loading and unloading of pieces, the Gang Drill can be made one of the most valuable machines in the shop.

Our Booklet, "Jigging and Tooling," is the only one on the subject ever issued, and it contains facts in which every manufacturer will be interested.

It will cost you nothing but a post card. **Write now.**

THE
ROCKFORD
DRILLING MACHINE Co
·ROCKFORD·
ILL., U.S.A.

3 SPINDLE 31 in. GANG DRILL



Much of the milling in most shops is not heavy cutting.

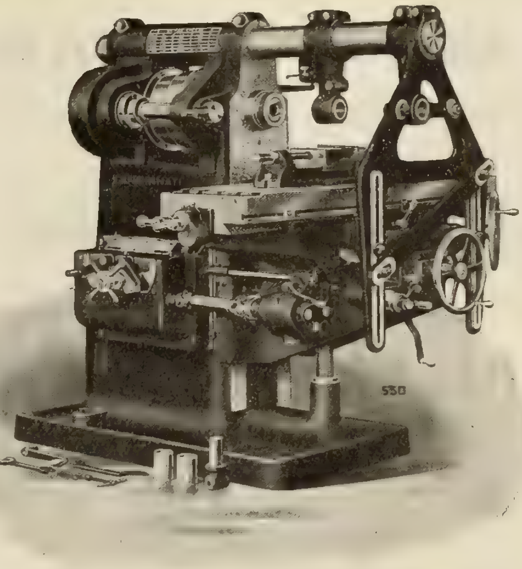
On this work the very powerful single pulley millers do not increase production.

An up-to-date, properly designed, cone-driven machine like our No. 4 Horizontal often proves the better investment.

It is our "High Power" Miller with cone-driven spindle.

We have simply replaced the Single Pulley, geared Spindle Drive Box with a Double Back Geared Cone of large diameter.

It has ample power for all that work requiring a large machine, but not excessively heavy cutting. It can be depended upon for long, hard, continuous service, because of its massive "High Power" construction.



Its maintenance cost is low because of its simplicity.

AND IT IS HANDY.

The Feed Changers and Back Gear Lever are where the operator stands to shift the belt.

The Table always feeds in the direction in which the Engaging Lever is set.

This same lever also reverses the feed.

All Controlling Levers are at the front of the knee and saddle. So is the Quick Return.

Everything that has to do with its operation is within easy reach.

And there is an additional lever at the side of the knee controlling the feeds from behind the table, for end-milling or boring or similar work which can't be successfully done when the operator stands in front, as he must do on all other Millers.

Let Us Help On Your Milling Problems

We make the largest variety of machines and therefore can recommend the ones best suited for your work.

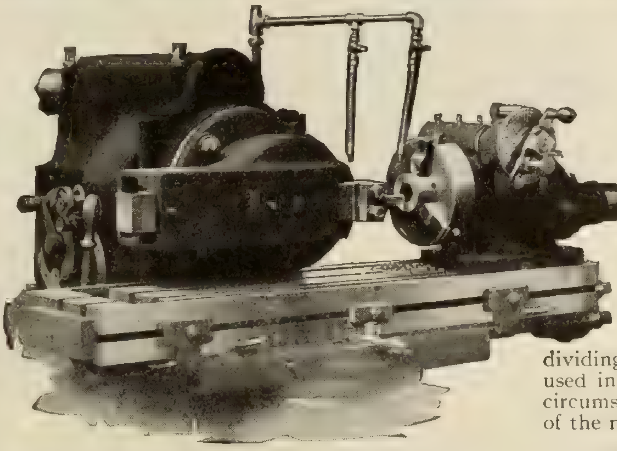
The Cincinnati Milling Machine Co., Cincinnati, Ohio, U.S.A.

CANADIAN AGENT—H. W. Petrie, Limited, Toronto, Montreal and Vancouver

---

WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 16—
Slotting Attachment



Every shop, and especially every tool room, has some work for a slotter, not always, however, sufficient to warrant the expense of installing a slotting machine. Used on the Universal Miller the slotting attachment will fill this purpose admirably.

The slotting attachment for Milwaukee Universal Millers was designed with an eye to thoroughness and efficiency and we have embodied in it features which adapt it to rapid production just as though it were a complete standard machine to be used continuously on this class of work.

The ram is a rectangular steel bar, ground to size. It carries hardened steel V-Jaws at the end for clamping the tool, a construction much preferable to round hole and set screw in that the tool can be any size from ¼ to ¾ in. and any shape, rough or finished. This advantage is most appreciated when the machine is set up and waiting for some special tool that can be quickly improvised in place of waiting to be turned and finished to fit a certain hole.

The stroke of the ram can be adjusted anywhere from 0 to 4 in. The cutting stroke is one-half the speed of the return, thus increasing output over a one to one stroke and return.

The ram can be swiveled through the entire 360°. It can be used in a vertical position for slotting out large dies, using the rotary table in connection with it where necessary. It can be used in a horizontal position, as shown in the cut, for cutting out internal gears or for other work requiring the indexing feature of the dividing centers. In fact, it can be used in a host of different ways as circumstances demand and the mind of the mechanic suggests.

"WHYS" in favor of Milwaukee Millers of all types. "WHYS" regarding their tools and attachments. These are facts which hold value for those who use or intend to use Milling Machines. Write for our Bulletins.

Taper Threading

Is not an expensive operation when

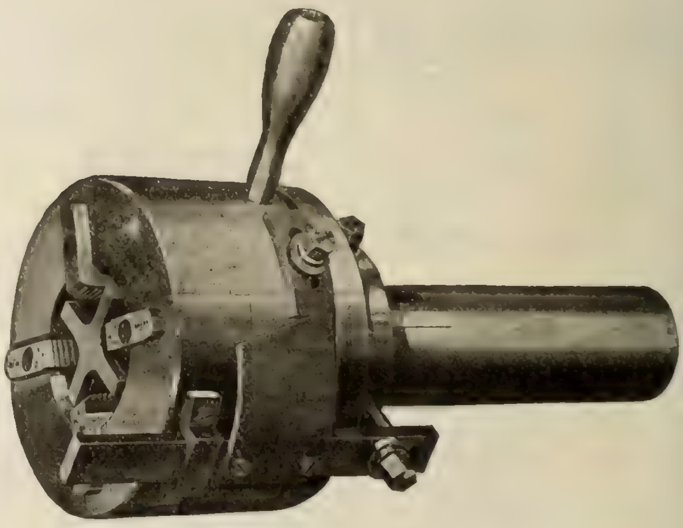
GEOMETRIC TAPER THREADING DIE HEADS ARE USED

These Die Heads are specially adapted to Screw Machines and Turret Lathes. Can be applied for the taper work and then removed, leaving the machine free for other work.

Our TAPER THREADING DIE HEADS and TAPER TURNING TOOLS

are made to order, specially fitted to meet the requirments of machine and work.

Employed to great extent on work such as Locomotive Wash-Out or Mud Plugs, Spindles for Buffing Lathes, Corporation Cocks, Special Faucets, etc.



The chasers automatically follow the taper of the work, no more power being necessary for cutting a taper thread than for a straight thread of equal diameter. The chasers automatically release the work at the end of the cut, and the Die Head is withdrawn without touching the threads This gives quantity and quality—a large output, and threads of superior finish.

Consult us about your taper threads.

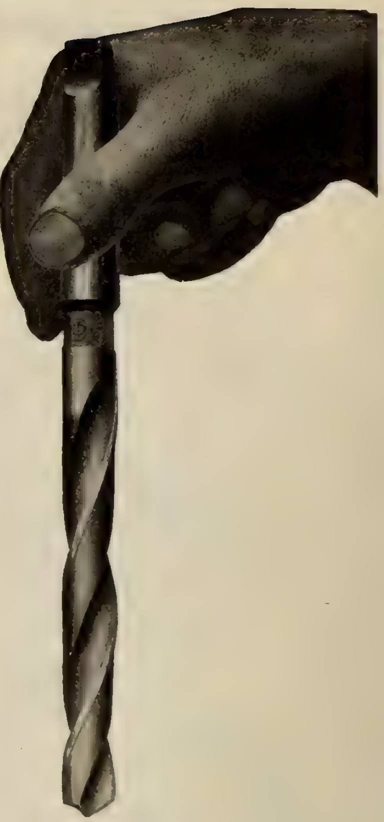
MODERN TOOL COMPANY

State and Peach Streets **ERIE, PA., U. S. A.**

Right to the Point

Follow the drill right to the point and you'll find that it's *right* to the point. You'll also see our trade-mark, the high-efficiency sign.

It is a guarantee that every drill bearing it must give satisfactory service or cost you nothing; must be first-class in design, material and workmanship.



"Detroit" Twist Drills

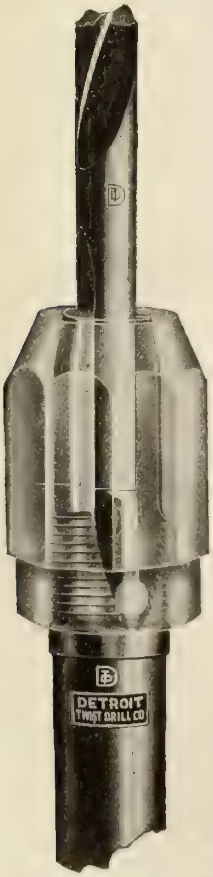
(*Made in Detroit*)

save the time of both men and machines. They cut production costs by cutting down the percentage of unproductive labor. The wasted time—that is, the time spent in sharpening and grinding, in setting and resetting tools, the time spent in running back and forth from drill press to grinder, etc., is all unproductive. And it's costing you good hard money.

Trade

Mark

Let a test prove that they possess the four factors essential to accuracy and greatest capacity for work :—



1. Both cutting lips have the same inclination to the axis.
2. Both cutting lips are equal.
3. Proper contour of the surface back of the cutting edge
4. Proper angle of lip clearance.

In one large manufacturing plant "Detroit" Drills are working in drop-forged .40 carbon steel. They are drilling 1 in. holes 1⅜ in. deep at 265 R.P.M. with .020 feed and getting 190 holes between successive grindings of the drill.

They will do as much for you.

"Detroit" Drills are ground to the 1-2000 of an inch. There's a drill of the exact size and kind for every drilling need and every one is guaranteed.

We make all kinds of small tools and have the experience, the equipment and the determination to make our service the most satisfactory you have ever known.

Write to the point—Today

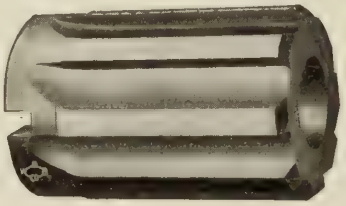
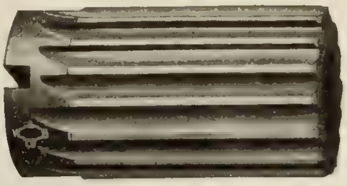
Efficiency and Organization

The character or quality of being efficient is "the ratio of useful work, or the effect produced to the energy expended in producing it." Energy expended is the foundation of tool use and cost of production.

Reamers designed to save wasted energy and to do the work at the Lowest Cost Per Piece are REAMERS OF EFFICIENCY.

Take any "W. & B. Diamond" Carbon or High Speed Steel Reamer and you will find they require less energy to operate than other makes, and reduce cost of production.





Tools of Quality

W&B

Bear These Marks

If you are not using the "W. & B. Diamond" line, go to your nearest Dealer and select the reamer you require for the job in hand. Put it to the commercial test and the results will prove to you the vast savings that can be accomplished from using "W. & B. Diamonds." Be sure you get the reamer bearing the "W. & B. Diamond" Trade Mark.

If your jobber or dealer cannot supply you, write us and send for Machinists' Supply Catalog No. 82-F and circular, "Efficiency or Wasted Energy."

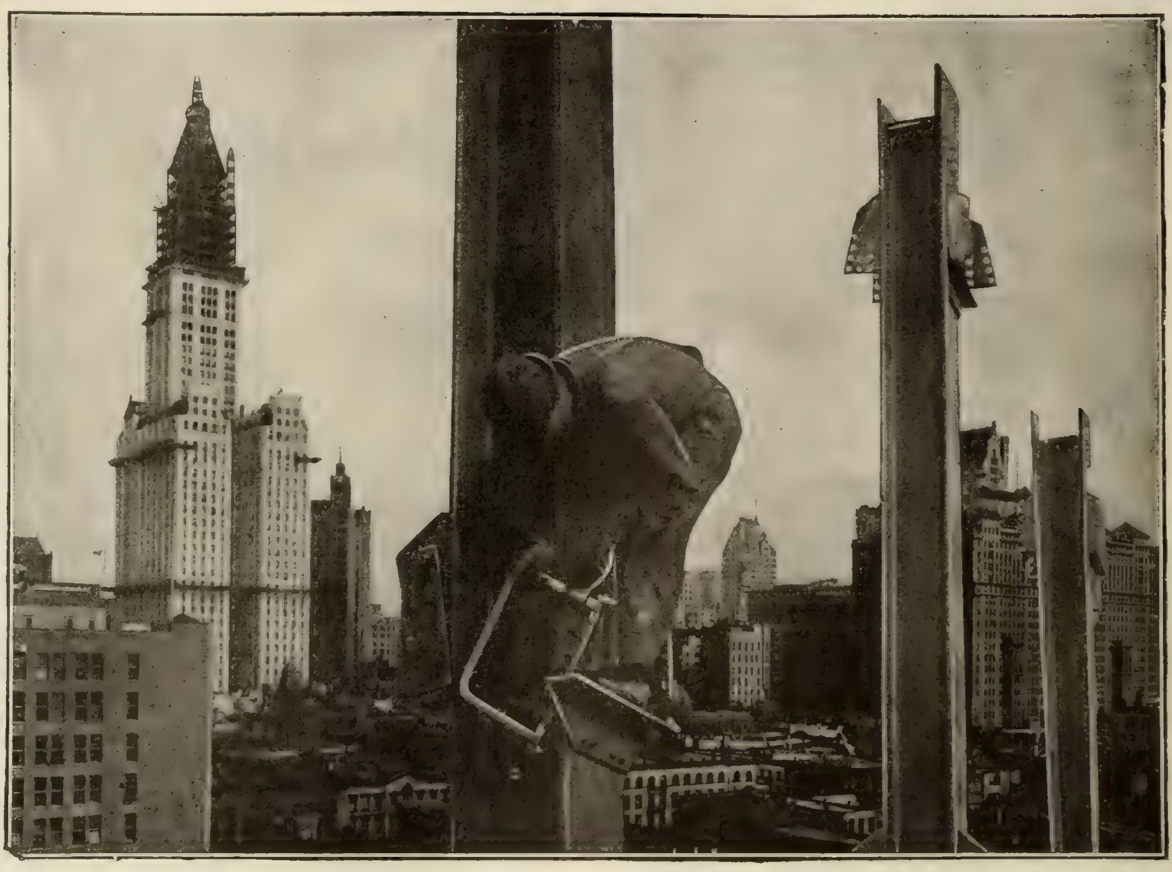
VICTOR FLEXIBLE HACK SAWS



**Twelve Times Less Breakable than Full Tempered Blades—
Exactly the Same Cutting Power as the Finest VICTOR "All-Hard"—**
that is why the

VICTOR FLEXIBLE

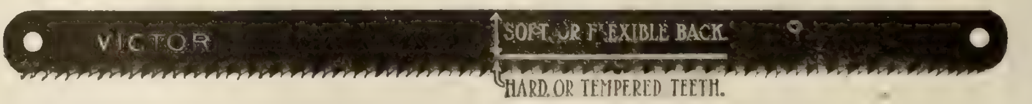
Is the Most Economical Hack Saw Manufactured

DON'T confound VICTOR flexible hack saw blades with either the old-time flexible back, or the clock spring steel blade, which have given flexibles such a bad name. They are as different to a VICTOR Flexible as an inferior, cheap file is an A-1 Swiss file.

VICTOR Flexible Hack Saws are made from VICTOR Private-Formula Steel, a high-grade alloy containing Tungsten, Vanadium and other high-speed components. They have the supremely tough, milled teeth of the finest hard blade combined with a flexible back of great strength.

For this reason VICTOR Flexibles will cut exactly the same metals as the best full-tempered blade, but last indefinitely longer because they

Cannot Be Broken Except By Intentional Misuse



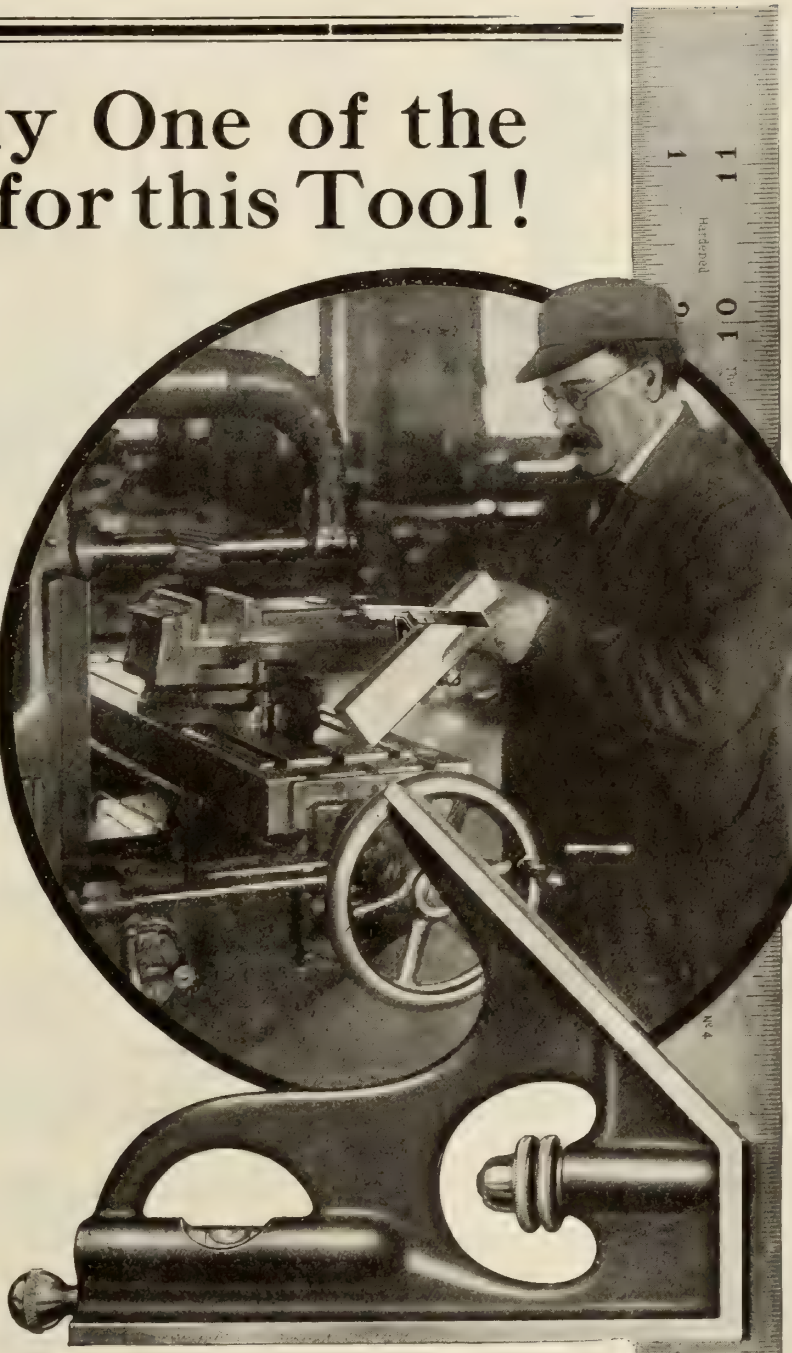
Do you know that 75 per cent. of the "all-hard" blades used in hand frames break before they are worn out? Watch the "all-hard" blades in your own shop and see the enormous rate of the breakage. Then use VICTOR Flexibles, that never break in the average workman's hands, and note the economy.

VICTOR SAW WORKS, LIMITED

Adam Street **Hamilton, Ont.**

This Is Only One of the Seven Uses for this Tool!

Used as a square it has all the characteristics of the ordinary square but with the advantage of having a blade that will slide to any desired position. The level in the body of the head makes possible other uses not obtainable with the ordinary square. This tool is the



Starrett

Combination Set

It combines in this one instrument the tools used most frequently by a machinist—the rule, square, bevel, protractor, level, centre head, and depth guage. The centre head and protractor may be slipped on or off in the scale in a second, permitting combinations which accomplish much more than any of the individual tools could.

Now this is only an example of what *one* of the Starrett tools will accomplish. We have other tools which for their particular service are just as efficient. The line includes such tools as

Rules
Dividers
Drill Blocks
Scribers
Squares
Center Testers
Gages
Speed Indicators
Calipers
Clamps
Micrometers
Test Indicators

Why not send for free catalog 203, and learn which tools your work requires?

This Tap Cuts—
Most Others
Scrape

"LIGHTNING"
MACHINE RELIEVED
1

Made By
The Pioneers

This tap cuts—cuts freely, like a milling cutter or a lathe tool. It's machine-relieved. The top, bottom and angular walls are backed off to give clearance. There's no binding, no dragging, no undue friction.

"Lightning" Taps

"Lightning" Taps do not depend upon the first few threads for their size, but are true to size from one end to the other. Re-sharpening does not make them undersize, and the last hole tapped is exactly the same size as the first.

A very much longer life is the result. And longer life means cheaper tapping per hole. "Lightning" Taps are sold based on final results —not on first cut. **We** assume all risk. **You** pay after the results secured—not before.

High Speed Steel Has a Solid Foundation In a Name That Means Something

Cutting speed attained on cast iron: Roughing cut, 140 ft. per minute—finishing cut, 210 ft. per minute.

In NOVO SUPERIOR you secure a materially increased speed over the high speed steels now in use, the highest quality, greatest toughness, longest life (3 times that of any other) and exceptional ability to cut very hard materials. The cutting edge retains its sharpness from 3 to 4 times longer than other high speed steels. Hardens in oil, air or water, and is now carried in stock in our warehouse in all current sizes, flat, squares and rounds; annealed and unannealed.

The gas light was a big improvement over the tallow dip, but it had to give way to the electric light; and the Tungsten has superseded the little glimmer that once delighted us.

If you are still employing pipe cutting methods as antiquated as the tallow dip, you need a Williams' Pipe Machine, which occupies the same position in the pipe cutting field as the Tungsten does in the lighting world, to bring you up-to-date.

Let us quote you prices and terms: any machine to cut 10 sizes of pipe between 1-4 inch; and 18 inch; with any kind of power.

Anyone making, selling or buying a pipe machine, claimed to be a Canadian-made Williams' Pipe Machine does so without right or authority from us and is liable to prosecution for damages.

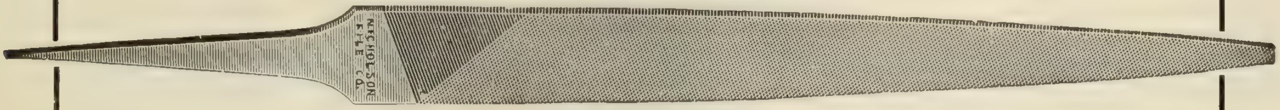
To Get a Filing Department of Maximum Efficiency

NO matter whether shop, piece-work, fitting or assembling department, it pays to have sharp files in constant use.

It pays to give an 18, 20 or 25-cent file only a set and definite length of service, especially in the hands of your highest price labor.



By using a file only (say) 6 hours, and then discarding it, you conserve the skill and effort of your workman to finishing pieces, and do not fritter it uselessly away in pressure with a dull file, fatigue, skimped work, and errors.

"Nicholson-made" Files have teeth of exceeding sharpness, made glass-hard by a private process. The steel is of special formula. Each file is hand tested. As far as humanly possible, "Nicholson-made" Files are unvarying in "feel" and cutting power.

Study the economics of your shop where filing is done. Use "Nicholson-made" files, to enable full filing efficiency to be reached.

All Jobbers.

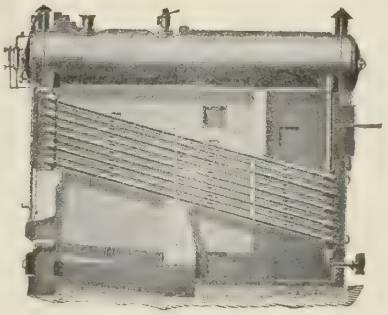
Do You Realize the Importance of Using Reliable Fire-Brick Cement?



The cost of maintenance of your fire-brick walls and arches depend greatly on the efficiency of the binding materials used.

Fire-clay and like materials readily fuse and run when subjected to intense heat. This necessitates frequent repairing and is also likely to result in the collapse of the entire structure—involving considerable expense and delay.

J-M HIGH TEMPERATURE CEMENTS

solve this important problem economically and permanently. J-M Cements will successfully resist all temperatures up to 3100 degrees Fahrenheit. Their efficiency is lasting and they reduce maintenance cost 50%.

If you're anxious to overcome existing troubles at your plant, write our nearest Branch to-day, stating class of furnace, temperature and adverse conditions, and we'll promptly tell you the remedy.

ARCTIC METAL

Why We make Arctic Metal

Because the consumers are looking for a babbitt that is always uniform; that will stand up under Heavy Pressure; that will keep cool under High Speed.
The consumers have found these conditions in

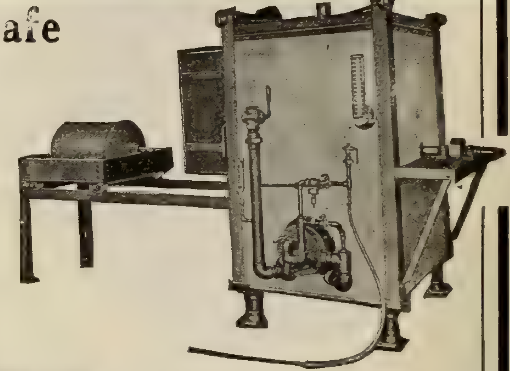
Arctic Metal

Manufactured by

Tallman Brass & Metal Co.
HAMILTON, ONT.

THE CRAWFORD SECTIONAL OVEN
PAT'D NOV. 20, 1906
THE OVEN EQUIPMENT AND MFG. CO. NEW HAVEN, CONN.

Why the Enclosed Flame Burner is Safe



Air, forced into the large cylinder or generator, will support combustion under any conditions. So long as air is supplied, the flame cannot go out; and the automatic valve shuts off the gas whenever air pressure fails, due to stoppage of power or other cause.

With open flame burners, the flame becomes low when oxygen is exhausted from the air around it, and some of the jets at back end go out; or only a part of the gas coming through the outlets continues to burn. The unburned gas, filling the oven, ignites explosively. This condition is much aggravated whenever the oven is forced to a high temperature.

For this reason the

CRAWFORD Sectional Oven

with its Enclosed Flame Gas Burner is **far safer** than any other type. It can be run with entire satisfaction at much higher temperatures than are safe with open flame burners.

Built especially for **baking, bluing, drying, enameling, japanning** and **lacquering**, this oven finds a rapidly increasing use in all industries using heating processes. Best of all—half our orders are **"Repeats"** from highly satisfied users; an evidence of real merit.

Send for our latest folders, "Correct Core and Mold Drying," or "Drying-Out Armature Coils."

SAFETY FIRST

IS A NATION-WIDE MOVEMENT OF RECENT ORIGIN

INGERSOLL-RAND Air Hoists have been built for many years with Safety as one of the First and most important factors of the design.

Ingersoll-Rand Air Hoists

are built for Safety, Saving, Accuracy, Rapidity and Reliability.

Each part is as well made as the best workmanship can make it, which produces a Hoist unapproached for quick, reliable and accurate operation.

As an example of Safety, all cylinders are of sufficient thickness to withstand a load of double the rated capacity. The upper and lower heads are bolted together, taking all the strain off the cylinders.

The operating valves are of an automatically tight closing type unexcelled in every respect. A safety check valve prevents accident and adds to convenience.

BUFFALO

Direct-Connected

Blowers and Exhausters

NO UNEVEN BELT PULL

It has been proved that the combined power and maintenance cost of ''Buffalo'' centrifugal blowers and exhausters is less than that of any positive type of blower. Their installation insures a lifetime of continuous high efficiency service. The bearings are of the dust proof, double oil ring type, especially designed for high speed service.

The advantages of direct connection include saving of space, due to absence of belt pulleys and countershaft, absence of interruption from belt breakage, elimination of uneven belt pull, and other belt troubles, to say nothing of expense maintenance and decreased power consumption.

''Buffalo'' direct-connected steel pressure blowers include both motor-driven and ''Spiro'' turbine driven outfits. For installations in which steam is available, the ''Spiro'' is recommended as being by far the most economical small steam turbine now on the market.

Our engineering department is at your service, and on receipt of information covering service and installation conditions, will be glad to recommend suitable direct connected ''Buffalo'' unit.

Our catalogue No. 181-E will be furnished on request.

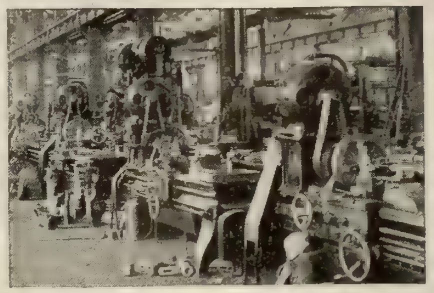
The best you can get
In Transmission Efficiency is the 99% of
Morse Silent Chain Drives

In addition to giving the highest attainable efficiency of transmission, MORSE Silent Chains last long enough to pay for themselves, by their saving of power, from one to four times over.



This illustration shows a battery of small lathes in a Railroad Machine Shop, each driven by a 3-h.p. Morse Silent Chain.

There are eighteen Morse Chain Drives in this one shop which have not been repaired in 10 years' service.

They give a silent, flexible, positive drive; permit high speed ratios on short centers; and work equally well, fully protected from, or exposed to, the weather, heat, dampness or dirt.

Can any possible objection of yours overcome so many features that recommend MORSE Chains to you? Write to-day for particulars.

MAGNOLIA ANTIFRICTION METAL

A Boy's Wages, Slewes of Oil and Trouble Galore Saved by Using

MAGNOLIA METAL

WEEKS BROTHERS COMPANY, INC.
167 to 179 Richmond St.

Providence R. I.,
June 9th, 1912.

Magnolia Metal Co.,
New York.

Gentlemen:—

Magnolia Metal was first introduced to me in 1901 at the Nova Scotia Provincial Exhibition at Halifax, Canada. I was at that time Engineer with J. G. Hamilton & Sons, Confectioners, Pictou and Halifax. We had a Sugar Pulverizer which ran 2,500 R. P. M. and we could not keep it cool. Had a boy stand all day with an oil can to keep it running. The journals were 16 inches in length, shaft 2 inches in diameter, bottom half cast in frame of machine. The night watchman and I after melting the old metal out with a plumber's torch and getting the shaft lined up, completed the job in about two hours. After that I speeded the machine up to 3,000 R. P. M., and we would fill the grease cups on Monday morning and it would run 10 hours a day for a week without any care or attention.

I cannot say too much for Magnolia. It is easy to pour and almost any novice can make a decent job. I wanted some hangers of a peculiar shape one time, and I got a piece of iron bar 4 inches by ¼ inch and made them into the shape required with loops for the bearings and babbitted them with Magnolia. Both these jobs ran every working day and were in good order without any trouble at the end of four years.

I always specify Magnolia Metal for all my work.

Yours truly,

JOHN S. BELL, Ch. Eng.

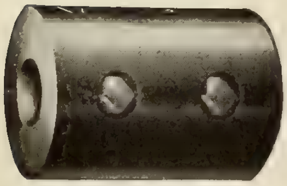
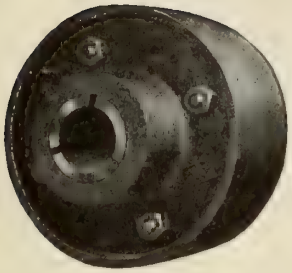
SHAFTING COUPLINGS



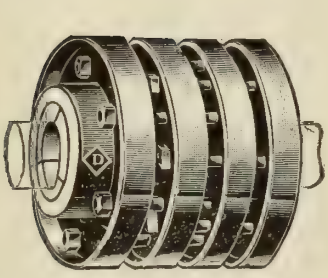
Solid Sleeve

DODGE SOLID SLEEVE

A low-priced coupling designed for light shafting, has countersunk set screws, and is finished over entire surface.



Single Compression



Double Compression

DODGE KEYLESS COMPRESSION

Built on the most liberal lines and calculated to furnish the manufacturing and supply trade with a coupling that can be had immediately from stock, and may be depended upon at all times to couple shafting without keyseating or keys, thus affording ease and despatch in erecting at a minimum cost. Made in two styles, Single and Double Compression. For shafting up to 2 7-16 inch diameter, we recommend the single compression coupling for ordinary duty. For larger shafting, we recommend the double compression coupling.

RE RENOLD SILENT CHAIN DRIVE.

Gentlemen:—In reply to your enquiry of Jan. 30th, I may say that the Renold Silent Chain Drives we have installed are giving every satisfaction.

Our first drive was installed to replace a 12-in. belt which was giving us trouble on account of short centres; this chain has run continuously for four years without the slightest trouble.

Our second drive was installed on a mixing machine doing heavy duty and which has previously broken up two sets of spur gearing, this chain has run over three years with no sign of wear yet.

Our third drive was installed on a calendaring machine after breaking two sets of helical gears, and this has been so successful that we are now in-stalling two more similar drives.

I would be perfectly willing to make an appointment with any person genuinely interested and show him the drive in operation.

Yours truly,——————,*

*Name on application.

The above comes from one of the largest manufacturers in Montreal and is signed by the Mechanical Superintendent. Up to the present (1913) these drives have not received repairs of any kind.

This same company have since made large extensions and we have executed for them many repeat orders.

Character—The Ruby Stone.

¶ Somewhere in one of his essays, Emerson refers to the fact that the ruby stone is formed by a process requiring millions of years—a period of time in which the Andes and the Alps, by comparison, come and go like the rainbow.

¶ Character is like the ruby stone. Each of us is a builder; a builder of habits, a builder of ideas, ideals, ambitions, hopes, fancies and builders of character. Character is a composite of many things; it is the unit or the form of the individual . Character is developed through experience. It represents the individual after having gone through the crucible of experiments, tests and temptations.

¶ The ideas and ideals we hold each day are molding our character into positive form. Character represents the best in man after it has gone through a long and determined process of refinement. The fact that we have certain beautiful aspirations, the fact that we hold certain beautiful ideals, is gradually transforming each of us into the very thing to which we work and aspire. The process of character-building is the most tedious, yet the most beautiful, thing in the life of the individual—a still more highly refined process than that which forms the ruby stone.

¶ The average man goes into business, not so much to make money as he does to expand, to grow, to evolve. The business man is a builder. He is restless, prompted by a desire to do, to act, to work, to be on his way. The man who is dishonest in business gives us an example of energy run amuck. We know a man by the kind of shop, store, factory or place of business he runs. His character shines out through his business affairs. It is written in the way he keeps his desk, the attitude of mind he holds toward his employees, in what he is wont to do for his customers, in the integrity he observes in all his business transactions with other men.

¶ Character building is building for all time. Men die and pass away. But character is like the ruby stone. It is the most precious, the most beautiful, and the most to be desired of all things. Mind you well the little things—watch you with care the tendencies which spring up mushroomlike here and there in your every-day conduct to destroy character. Remember, you are a builder; character is all you have, all that you can leave that will not pass away.

¶ Character is the monument you leave for those who follow after you. It is the measure of what you have been, of what you have said and believed; the measure of the truths you have discovered and made a part of you and your conduct. Character is the measure of your sincerity, the measure of the company you have been to yourself; and we know a man by the kind of company he keeps—when he is alone. Character is the monument you make and mold through having worked and lived. It is the ruby stone of your beautiful fancies, of your divine moments, the ruby stone of your better self.

INDUSTRIAL NOTABILITIES--No. 10

"RESOLVED: To deliver the goods in whatever position I find myself, and to give to others the same square deal I require for myself." By carrying out this resolution, Thomas Russ Deacon has become Mayor of Winnipeg, and President of the Manitoba Bridge and Iron Works. He gives this as the secret of his success. It required a man of this calibre to fill the Mayor's chair in Winnipeg. Towards the close of last year, Winnipegers saw big financial problems ahead, and they wanted a Moses who would lead them over this twentieth century Red Sea. They found him in Thomas R. Deacon.

People, as a rule, appreciate a man who delivers the goods, no matter whether he be making a bridge or running a city, and the people of Winnipeg appreciate their present mayor. Their representatives on the board of control and in the city council have asked him to run again. It is hardly likely there will be a run. The people of Winnipeg are not yet across the Red Sea, and they will stick to their Moses.

Red Sea is another word for the Shoal Lake water scheme, a tremendous enterprise which T. R. Deacon promised to undertake if the people elected him. He is carrying out his promise. The big engineering work has begun.

Besides being an excellent administrator, Mayor Deacon is an engineer of wide experience. He was born on a farm near Perth, Ont., on Jan. 3, 1865. He received an elementary and high school education, after which he took a course in engineering at Toronto University. He graduated in 1891.

THOMAS RUSS DEACON.

For eleven years he practiced civil engineering, and among the positions he held were those of town engineer at Kenora, Ont. (then Rat Portage), manager of the Ontario Gold Concessions, and managing director and consulting engineer to the Mikado Gold Mining Co.

In 1902 he moved to Winnipeg, where he founded the Manitoba Bridge and Iron Works. He was a member of the 1907 commission which inquired into the Winnipeg water supply; in 1910 was a member of the Royal Commission on the Workmen's Compensation Act; was for two years the provincial vice-president of the C.M.A., and for four years was a member of the council of the Board of Trade.

His wide experience and expert knowledge of finance, together with a deep insight into the commercial life of the city, and the ability to cater to the needs of each branch of business as occasions arise, have fitted him for the position of mayor of the Western metropolis, which he fills so ably. His chief connection with machinery has been in the founding and upbuilding of the Manitoba Bridge and Iron Works, which started operations in 1903, and now employs 400 men.

As manager of this Western city he has to protect the social, religious, and moral welfare of nearly 200,000 people, including representatives of almost every nation under the sun, who are being molded together into a heterogenous community called Canadians. This in itself is work that requires great engineering skill, and no more capable engineer could be found than Thomas R. Deacon.

Safety Devices for Reducing Accidents to a Minimium

Staff Article

Employers and workmen are beginning to realize that the time has arrived when they should take a live interest in the prevention of accidents, and consider the subject, not only in relation to their own safety, but also as it affects the welfare of those dependent upon them. The writer of this article tells what Mr. George Bradshaw, safety engineer, has done along these lines.

THROUGH one reason or another, the work of the mechanic—using that term to cover all men who operate machinery, has become one of the most dangerous occupations outside that of railroading. Never a day passes but the Press in every part of the country records the death of or injury to a machinist due either to carelessness, defective machinery, or improper method of operation. As a rule the accident does not end there. If any fault lies with the employer, he has either to hand over a big sum of money to the man or his dependents, or fight the case in the courts. Both of these are distasteful, for besides meaning the loss of money, he is put to considerable worry and trouble, and much valuable time.

A step is now being taken towards reducing the number of accidents in machine shops and in every industry by systematic education of employer and employe in the causes of accidents. On the face of it this seems absurd, as it might be argued that anybody who looked for causes would find them easily. This is not so. After this system of education has been undertaken, it is common to hear heads of concerns say: "It's strange we have been going through these shops every day, and have never before noticed these dangerous conditions and practices." It is not strange at all, because this class of work has become a specialty. It requires an expert, just as it takes a bacteriologist to find fever germs.

This subject has been brought to the fore in Canada lately by the employment of George Bradshaw as safety engineer by the Grand Trunk Railway. He is a specialist in this work, and accepts contracts from railway and industrial corporations. During the time for which he has been engaged, Mr. Bradshaw will inspect the road, shops and other activities of this railway, and will report the conditions and practices causing, and most likely to cause injuries, and will make practicable recommendations for their prevention.

For the past ten years Mr. Bradshaw has been employed by two American railway systems—the Chicago & Northwestern and the New York Central—for the study of personal injury problems, through the patient and persistent investigation of facts. Certain conclusions were formed as to the correct principles of accident prevention. As a result of the application of these principles on the New York Central lines, the average decrease in injuries in the company's 18 shops, amounted to 42 per cent. Fatal injuries to employes decreased 15 per cent. during the last six months of 1912 as compared with the same period of 1911.

GEORGE BRADSHAW,
Safety Engineer.

70 Per Cent. Less Injuries.

In the fall of 1911, the officials of a large New York corporation sought Mr. Bradshaw's advice on accident prevention in their plant, where many hundred men were employed. He studied their personal injury problem, inspected the plant, and made a report embodying definite recommendations. These recommendations were complied with, and in 1912 the record, compared with 1911, showed a decrease in injuries of 70 per cent., and a reduction in the personal injury account of 60 per cent.

Mr. Bradshaw and his assistants, when given a contract for the prevention of injuries, make a close study of the company's personal injury record, inspect the machines and shop conditions, and report where safeguards are required. They put into practice the devices evolved by work on the New York Central, devices which have been made standard in every shop on that system. They also tell and show employes unsafe and safe methods of doing their work. Much of the matter used in this article is the outcome of Mr. Bradshaw's work along these lines.

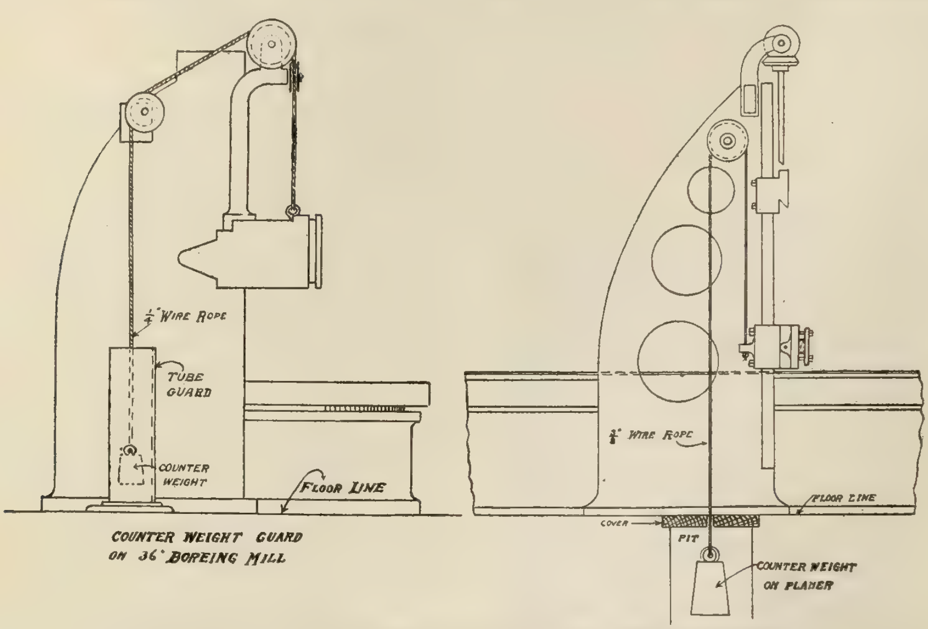
Cause of Accidents.

Broadly speaking, preventable accidents are due to three causes, or a combination of causes:

1.—Defective or improper condition of structures, equipment, machinery, tools or appliances.



COUNTERWEIGHT PROTECTION ABOVE AND BELOW FLOOR.

2.—Improper methods of work or operation.

3.—Failure of one or more men to use necessary care and diligence.

In other words, every preventable accident is due to some failure of material, method or man. Employes are not responsible for the first two causes, but they are for the third. Man, the human element, is almost wholly within the control of the employe. Material and method are subjects for official consideration.

The first step in the solution is absolute sincerity. The official must not forget that yesterday he was an employe, and the employe must reflect that tomorrow he may be charged with the official's duties. The remedies are:

1.—Improve and make safe defective conditions of structures, equipment, machinery, etc.

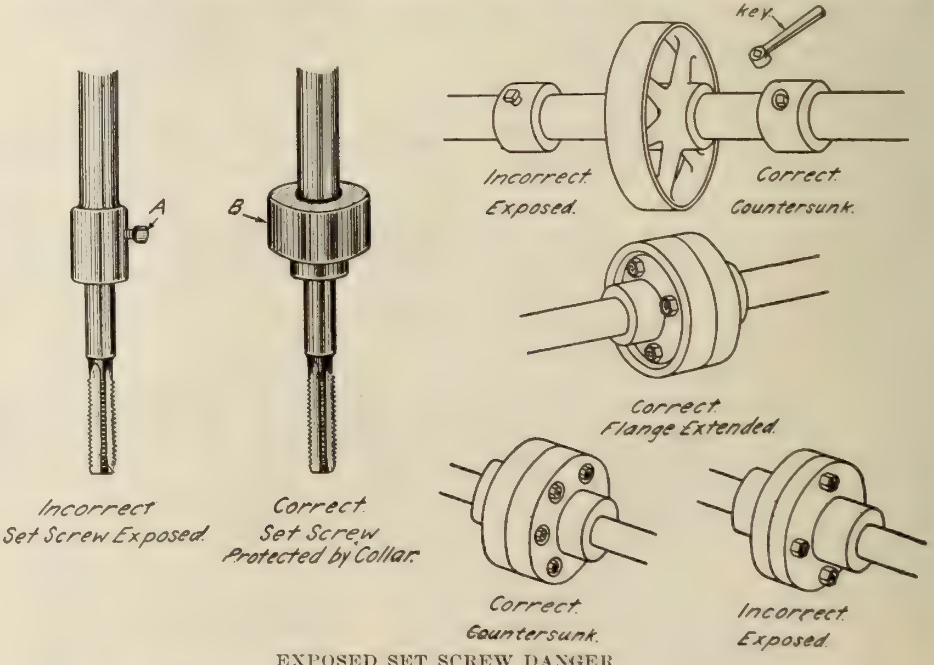
2.—Correct improper method of work or operation.

3.—Educate employes to use necessary care in the discharge of their duties.

By pursuing these three remedies intelligently and persistently, preventable accidents will be decreased materially. Most important of all, the employe must be educated and trained to obey rules. Officials may go on issuing rules, bulletins and notices, and the accidents will go on too, until the employe is convinced that he can do his work without accidents. It is the neglect of little things, not thought worthy of attention, that produces the bulk of preventable accidents. In many shops there are positive instructions to stop certain machines before attempting to oil or adjust them. Yet some men, sometimes piece workers who want to save every second, are continually taking chances, and often get chopped to pieces. There are men in shops who will deliberately remove safety guards from machines they are operating.

Safety Devices.

Fortunately, the remedies for accident prevention, so far at least as safety devices go, are numerous, easily applied and generally of little expense. Almost all machines, tools and appliances can be rendered reasonably safe for proper operation by the installation of safety guards and appliances, which, for the most part, can be constructed in the ordinary shop from scrap or other cheap material. There is hardly any limit to the extent of the application of these devices. Of course in the purchase of new machinery, it should be stipulated that all parts be guarded by the manufacturer to the fullest extent necessary. The proper time to apply safeguards to any machine is when it is made, but, until recently, manufacturers gave almost no attention to safeguards.



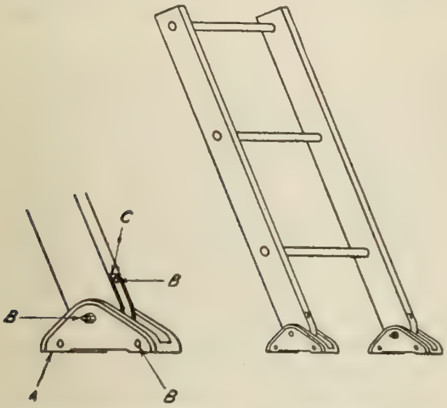
EXPOSED SET SCREW DANGER.

It must not be supposed from what has been said that the construction and application of safety guards is a matter of such simplicity as to require little thought and skill. Quite the contrary. In the first place, intelligent workmen—even foremen in charge—often need to have their attention called to the presence of danger and the necessity for guards. They are often entirely unconscious of dangers which confront them every minute of the day until some one points them out.

A heavy, sagging, and fast moving belt, running over a work bench, just high enough to clear the heads of the men at the bench is a common sight. The men are always liable to be caught by the sag of the belt, or struck by it if it should break. Protection may be afforded by placing immediately beneath the belt a wide plank, supported by brackets from the side wall.

Dangerous Set Screws.

Set screws on revolving spindles, in such positions that the operator has to reach around the spindle to reach the clutch, are one of the commonest sources of serious accidents. Such an instance has only recently been engaging the attention of the courts of Montreal, and was a costly business to those who used the set screw in this manner. Workmen who operate machines with exposed set screws of this character, are liable to have their clothing caught, and their arms broken. Often men are killed through this innocent-looking appliance. The unfortunate thing is that foremen and employers do not realize the danger of exposed set screws until a man is injured, and a thousand dollars or so has to be handed out for compensation. All set screws, nuts and bolt-heads projecting beyond the surface of the revolving parts, wherever located, should be counter sunk or protected by safety collars or flanges.



LADDER WITH SHOES OF BASSWOOD TO PREVENT SLIPPING ON SMOOTH FLOOR. A, METAL PLATE; B, BOLTS; C, METAL STRIP AROUND END OF LADDER.

Wire Guards.

Gears at the end of lathes should be rendered safe by means of wire or sheet iron guards. As it is necessary to change the gears, the guard should be made to set on the floor and extend around the gears. Such a device can easily be removed. The only criticism that can be levelled against such an arrangement is that the operator is liable not to replace the guard. Where possible the guard should be attached to the machine by means of hinges. Gear wheels should always be guarded over the exposed parts, and both ends of the guard should be securely attached to the machine. Where the wheels are solid, rim guards may be used, these extending over the teeth.

Pulleys, flywheels, and other dangerous machinery near floors should be protected by a complete enclosure of wire of fine mesh or of sheet metal as well as by railing. Machinery in places where people have no business should also be guarded, as an injured careless man is almost as serious as an injured careful man.

A simple and effective device for preventing injury by flying chips from a machine, consists of a canvas bag, with a small area of glass for vision, held by movable support. Cloth is preferable for this purpose to other material, because it prevents the chips from rebounding. A screen of fine wire serves the purpose where it may not be desirable to use cloth.

Dangerous Ladders.

It is a common thing to see a man working around shafting, mounted on a cheap ladder which might at any moment be precipitated owing to the oily nature of the machine shop floor. In such cases, "spuds" should be used. Where the floor is of cement or of a material on which "spuds" cannot be used, then the ladders should be fitted with "shoes" made of basswood, which do not readily slip on cement or other smooth floors.

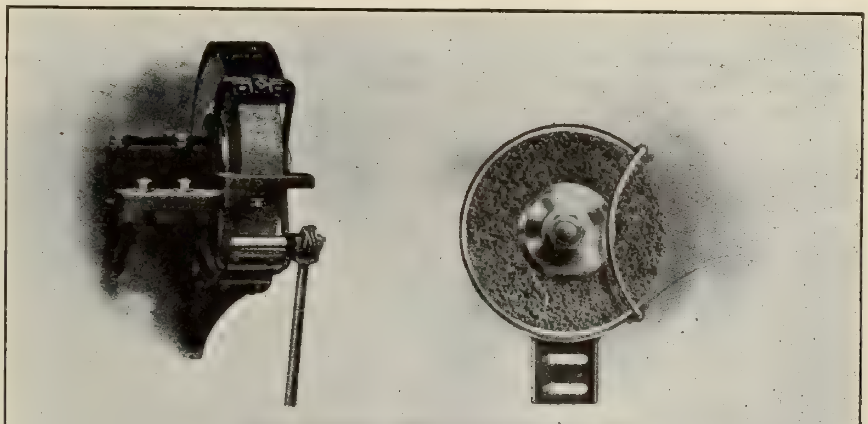
Machinists incur needless risk by the nature of the clothing they wear, which must necessarily come in close contact with movable parts of machines, all of which cannot be enclosed by guards. Loose, baggy clothing, especially sleeves, are liable to get caught by machinery and the operator drawn into the machine. Injuries due to this cause are by no means infrequent. Men engaged in this class of work should wear snug smooth-fitting apparel with short sleeves. Rings should be removed from the fingers and watch chains not permitted on outside of clothing.

When material is being raised or lowered over a passageway in a workshop where employes are accustomed to walk, the floor space should be railed off where there is danger. It is not sufficient to depend on signs warning men of the danger. If the hoist is of a permanent nature it should be properly protected. If of a temporary nature and not protected, someone should be stationed to see that employes do not walk in the danger zone.

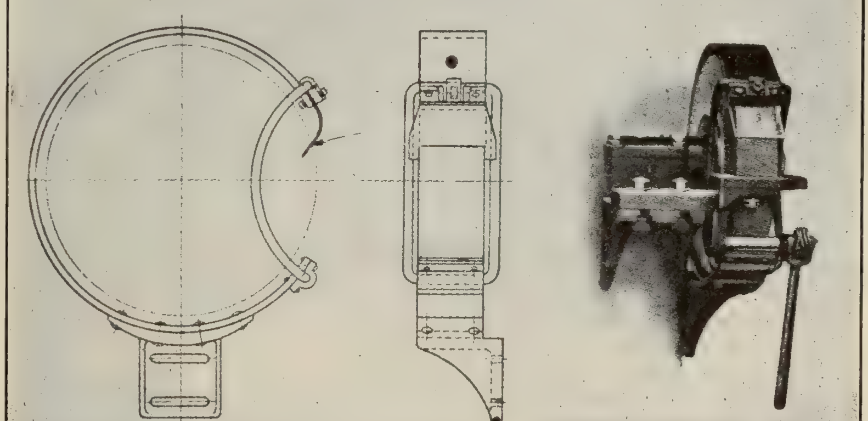
Defective Floors.

Little mistakes often result in the most serious consequences. When a floor is being repaired, the hole should never be allowed to remain unguarded. An instance is known in which a man pulling an iron horse across the shop stepped backwards into such a hole, and the horse fell on him, killing him. In shops where large numbers of men are employed, defective floors are a menace.

In plants where there is a gallery over-head for the storage of supplies or for anything else, a toe board should be used to prevent anything falling on to workmen below. This should be provided on all balconies, scaffolds or platforms where men are employed beneath. It is a very simple device, but might mean the saving of a man's life, and a big sum to the company.



AN APPROVED TYPE OF PROTECTION HOOD

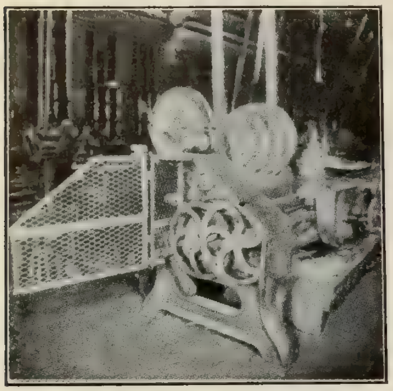


PROTECTION HOOD AND LEATHER SPARK BRUSH

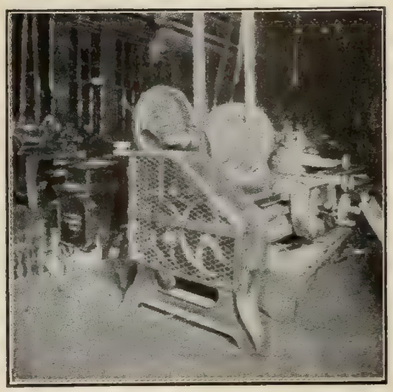
PROTECTION HOOD AND GLASS SHIELD EXTENDING OVER REST

EMERY WHEEL PROTECTION.

A common cause of injury in shops and roundhouses is stumbling and falling over material, tools and rubbish left in aisles and passageways. An air hose will cause a shopman while hurrying along, to trip and fall injuring his knee. This is only one more of the many instances of how little things to which ordinarily, slight attention is given, may cause serious results. It is not at all a difficult matter to keep aisles and passageways clear if all employes in the shop have their attention called to the necessity of doing so. Throwing things down anywhere is a bad habit which should be avoided in shops as elsewhere. Besides, more work can be done in a shop where employes can move freely without having to pick their way to keep from stumbling.



END GEARS OF LATHES.



EXPANDED METAL GUARD.

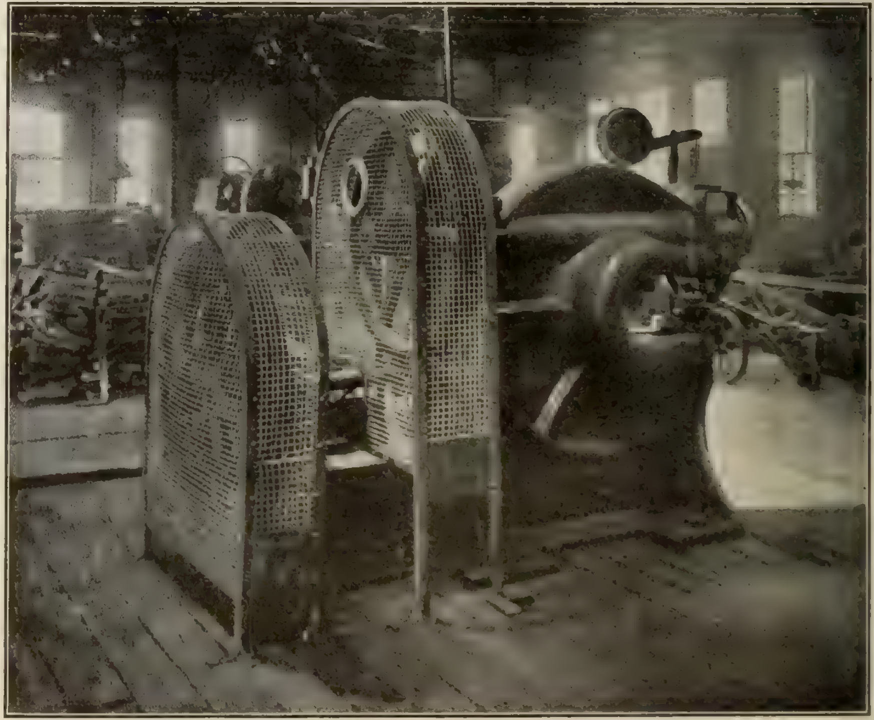
Danger Signs.

Danger signs mounted on posts should be kept around the shop so that employes who have work to perform around shafting may place the sign near the foot of the ladder before ascending. Danger signs should also be provided for dangerous electrical terminals and switches intimating that the guards are not to be removed except by experienced electricians. In the case of machinery which cannot be repaired or oiled while running, a metal sign, with red enamel face and white letters, bearing the following words: "Stop this machine before repairing, oiling or wiping," should be attached to the machine by screws.

Unfortunately, a printed sign as a means of calling attention to danger, is very unsatisfactory. It requires too much space, and cannot be read by any except English-speaking workmen. What is required is a simple, distinctive and suggestive symbol, adaptable to all places, and under all conditions. Care should be taken not to use warning signs except where there is a real danger.

In some shops, guards are painted red. This should not be done to indicate danger, because if the guards have been properly designed and applied, there should be no danger. If this practice has any merit at all, which is questionable, it merely serves to render the guards conspicuous, thus, perhaps, enabling the foreman, in passing through the shop, easily to observe any guard out of its proper position. It is not advisable to apply a special color to the guards, but to use such indication, or some sign or symbol, only upon those parts of machines or at those places in the shop which, by reason of construction or environment, cannot be made entirely safe by guards.

In boiler and machine shops one often sees a man striking with a hammer the head of a chisel or punch taken from an air hammer. He probably has no regular chisel or punch handy, and wants to save time and trouble in getting one—which he may do at the expense of the loss of an eye. Tempered steel is hard and chips readily, and the chips sometimes fly with great force. Every experienced machinist knows this to be a fact, but the records show that they are continually taking chances and getting hurt. This is one of the "little things" which should be explained to every machinist helper when he enters the service.



GUARDS FOR FLYWHEELS AND PULLEYS.

Injury to the Eyes.

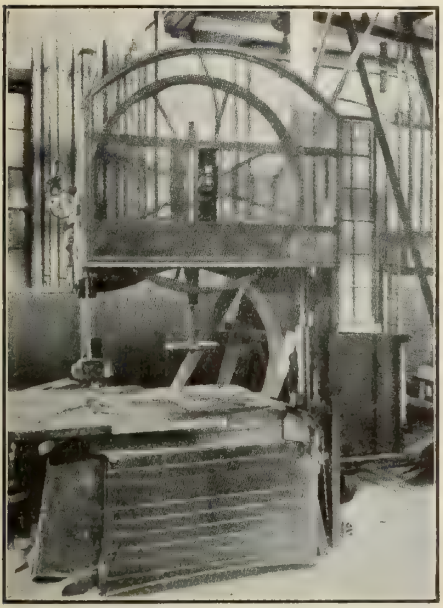
A large proportion of all injuries received by shop employes are eye injuries, frequently of a serious nature, resulting in permanent impairment or total loss of vision. The most common cause of this class of injury is to be found in flying particles of dust, sparks, chips and similar objects. Experience has shown that these injuries are almost entirely preventable by the use of a few simple and inexpensive devices supplemented by personal caution on the part of employes.

Eye injuries can be almost entirely eliminated by wearing suitable goggles. For emery wheel operators, any ordinary style of goggles will do, since the only purpose is to keep dust from the eyes. For the other classes of service mentioned, only those goggles should be used which have been specially constructed for the purpose which require, among other things, lenses of sufficient thickness, strength and adaptability and flanges to prevent flying chips from entering the eye from the side. Whether furnished by the employer or employe (in which the custom is not uniform) each employe should have his own individual pair, as the wearing of goggles in common may spread diseases of the eye.

Emery Wheel Guards.

Guards for emery wheels should be

made of strong metal (preferably boiler plate) so as to retain pieces if the wheel should break. The guard should completely enclose wheel (sides and rim) except necessary grinding surface, hinges being provided when necessary to remove the guard. Large wheels should be provided with exhaust for sparks and dust. It is very important that the rests be kept in the proper position. Experience shows that the breaking of emery wheels is frequently caused by the rest being too far from the wheel, thus allowing material to become wedged between the rest and the wheel. Flanges for emery wheels should be concave—never flat or convex—and of from one-third to one-half the diameter of the wheel to which applied.



BAND SAW GUARDING.

Dead Shafting.

All unnecessary dead shafting should be cut off. When necessary to retain dead shafting, it should be covered by a tube of smooth surface, of good and sufficient material. This tube is secured in a proper manner so that it will remain firmly in place around the shafting.

Counterweights above the floor should be enclosed in a secure casing. The pits for counterweights below the floor should be provided with a secure and safe cover.

Electric Shock.

Injuries are not infrequently due to shock from electric switch levers. These can be entirely prevented by completely enclosing the lever and points of contact by a box guard, which can be very easily made. The enclosing material should be metal to conform to the requirements of the Board of Fire Underwriters, and should be attached securely by bolts and not by hinges, a slot being allowed for projection of the lever.

Cranes.

Overhead cranes should be provided with runways the entire length of the bridge.

A safety switch should be placed on the bridge of the crane, the switch being such that, when pulled out, all power is cut off.

Sweep brushes, extending out from the truck wheels, should be placed on cranes, sweeping the rails, the purpose being to warn a person holding on to the rail of the approach of the crane.

Trolley wires entering the crane cable should be insulated.

Foot gongs should be placed on cranes.

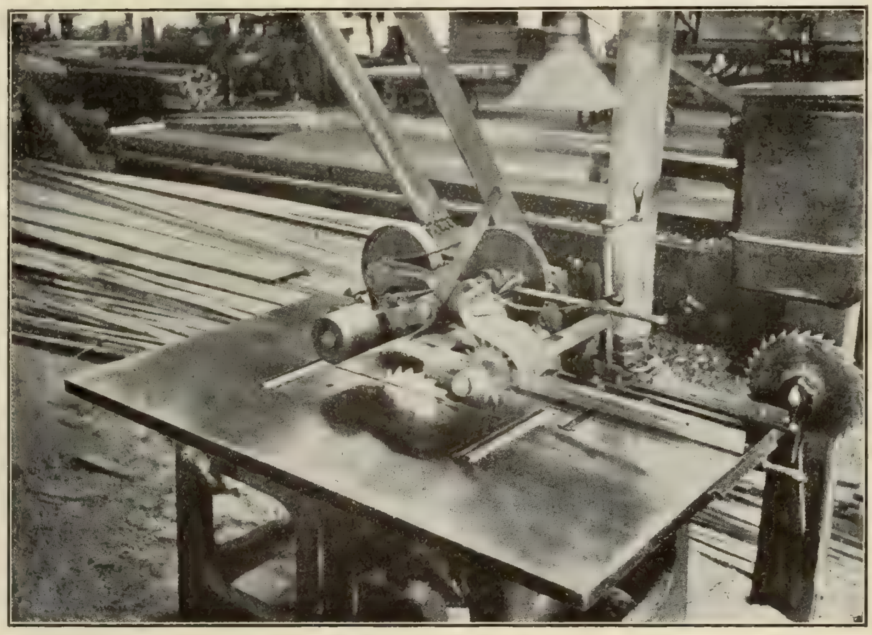
Bumpers should be placed at the end of all overhead crane runways.

Where there is more than one crane operating on a runway, each crane should be provided with temporary stops to be attached to the rails for the purpose of isolating a crane while repairs are being made on same.

Walks should be placed, wherever practicable, on buildings parallel with crane runways.

Stairs, or iron ladders terminating in a platform, should be installed as a means of getting to the crane.

Provision should be made to prevent overhanging gears from falling below should they work off the shaft. This may be done either by attaching a platform, equipped with a tight fence at the sides and ends, to the crane trolley, or by putting a walk on each of the bridge girders the entire length of the girder.



FEED WHEELS FOR SAW PROTECTION.

The fence on these walks should be made of angle iron, with a guard plate at the base of same, and the section between the guard plate and the middle railing should be enclosed with either heavy wire mesh or plate. The construction of this protection should be such that a wheel falling on it cannot roll off.

Hoist limit switches should be placed on cranes where practicable.

Cranes should be equipped with load, motor and foot brakes. Plungers and weights of brakes should be so encased that they cannot fall should the supports break.

Each crane should be provided with a red lamp, to be used as a danger signal when the crane is down for repairs. This signal should be so placed as to be visible from all approaching cranes.

Dinkey or open-type controllers should be provided with an asbestos-lined steel guard over the movable contact parts, to protect the operator's eye from flash.

A box or other receptacle should be placed on cranes or runways, in which to keep oil cans, tools, etc.

Limitations of Safety Devices.

In any systematic plan for accident prevention it should be kept in mind that while safety devices are necessary and important, they afford the means of preventing only a small percentage of accidents. Important as these devices are, too much has been expected from their use. If all men, at all times, were as careful and prudent as they could be, there would be little need for safety devices. The necessity for such devices is in inverse ratio to the careful and prudent habits of those by whom the devices are to be used. Indeed, there is in theory this objection to safety devices, that they tend to eliminate the necessity for personal thought and alertness. In other words, if it were possible so to cultivate the human element in machine shops without reduction of output or other detriment, so that accidents would be prevented, this method would be preferable to the use of safety devices, but as we cannot improve the human element to this ideal extent, we use safety devices to accomplish the purpose. They are at best but "devices" and their effectivenes for safety depends upon the intelligence and willingness with which they are applied and used.

Dont's for Machinists.

Don't try to shift a moving belt by hand.

* * *

Don't fool with electricity. It is dangerous.

* * *

Don't wear loose, baggy clothing, where it is liable to be caught in machinery.

* * *

Don't forget to replace all guards when through repairing a machine.

* * *

Don't neglect to report unsafe conditions to your foreman or superintendent. It is your duty, as well as your protection.

* * *

A guard is placed on a machine solely for your protection. Don't operate the machine without the guard in place.

* * *

Stop machine before oiling, wiping, or repairing it, and don't try to operate a machine you do not understand.

* * *

Don't swing a sledge or hammer that you know is working loose on the handle, thinking it won't come off till "next time." You may not be hurt, but "the other fellow" may.

* * *

Don't expect your helper to be as good a mechanic as you are. He isn't, or he wouldn't be a helper A little explanation as to the way the work is to be done may save injury to one or both of you.

* * *

If you know of some machine not properly guarded, don't wait till someone gets hurt and say, "I told you so." Tell the man in charge of the shop before an accident happens, and ask him to supply a proper guard.

* * *

Don't strike tempered steel with a hammer.

* * *

Don't go between or reach between large fast-moving belts.

* * *

Don't leave tools, material or rubbish between aisles or in walk-ways.

Don't wear loose, baggy clothing while working on or about machinery.

* * *

Don't throw boards or other material aside with points of nails extending upwards.

* * *

Don't think because an accident has not happened, it won't happen.

Reminders.

Belt shifters should be used on all pulleys where their use is practicable.

* * *

Secure railings ought to be provided, where practicable, for all stairways and platforms which are five feet or more above the floor or ground.

* * *

All switchboards should be guarded by a suitable gate or fence between the switchboard and the wall when located near wall.

The company by which you are employed wants you to take the time—the company's time—and do your work in the safe way.

* * *

After an accident has happened it is so easy to think how it could have been avoided. Try to think about prevention before "something happens."

* * *

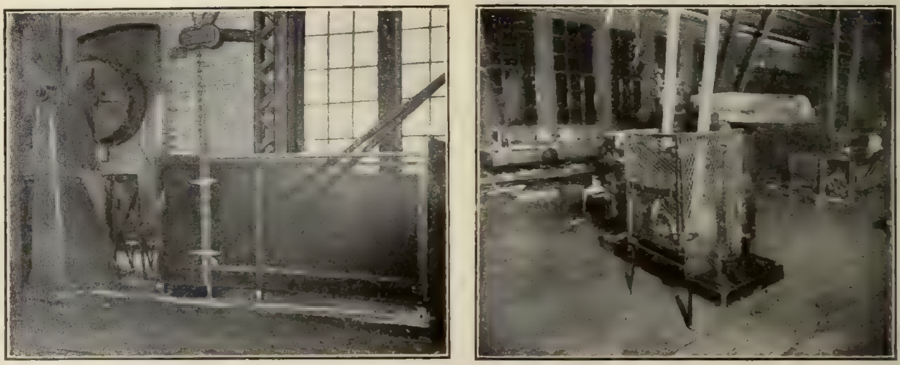
Unsafe practices on the part of employes cause three times as many injuries as unsafe conditions.

* * *

It does little good to have safe machines, tools and equipment if you don't have safe men to operate them.

* * *

An injury to an experienced man means that a new man must take his place. A new man is always an experiment.



PULLEY AND BELT GUARD.

Runways at least 24 inches wide should be provided for all over-head oilers, protected, where possible, on each side and at the end by a railing thirty inches high.

* * *

All wheels with spokes or holes located at or within 7 feet of the floor should be guarded so as to prevent spokes or openings in wheels from catching material, clothing or persons.

* * *

All passageways and gangways in shops, depots, and storage houses should be kept smooth and in good repair and free from nails, materials, tools, etc.

* * *

It is better to be careful a thousand times than to be crippled once.

* * *

Check yourself up on unsafe practices. Get the "safety habit."

* * *

When "safety first" causes a delay, it is worth it and time well spent.

A factory inspector chained to every machine in the shop wouldn't keep some men from getting hurt.

* * *

It's easier to do a thing right than to explain why you did it wrong.

* * *

A minute of judgment is sometimes worth a day of energy.

* * *

You have no right to take chances. The other fellow may have to take the consequences.

* * *

To be careless, thoughtless, or reckless means injury sooner or later to yourself or others.

Resolved.

I will work for my company as I would want one whom I might employ to work for me. I will protect myself, those dependent upon me and my fellow employe from the risk of unnecessary chances. I will do my part to reduce the number of personal injuries in the days to come.

Constructive Criticism Relative to Machine Tool Design*

By Edson R. Norris **

The Author of this Paper deals with a number of features in modern machine tool design which do not always contribute to the best interests of the user, and suggests as a basic condition towards offsetting the existing tendency that machine tools should not be designed to compass a wider range of work than their operators are called upon to perform, but that they should be equipped with such automatic devices as will decrease the operative skill required or reduce the operating cost.

IN recent years machine tool builders have been active in taking advantage of the many improvements suggested in the way of special devices, attachments and accessories for machine tools for the purpose of increasing the usefulness of the tools, lessening the cost of production, and in some cases reducing the skill necessary to operate. It is the object of this article to consider some of these special features from the standpoint of the large user of machine tools, yet giving due consideration to the demands of others whose requirements are different and whose lines of work are also often diversified in nature. The subject cannot be discussed without taking into account to some extent the designs of the tools, and what might appear as adverse comment in the illustrations of apparently faulty designs is merely offered in the way of constructive criticism.

Purchase Considerations.

It may be said that ordinarily the following reasons and conditions prompt the machine tool user to purchase equipment:

1.—To take care of an immediate increase in business.

2.—To provide for anticipated increase in business, and at the same time to reduce the cost of manufacture by replacing existing tools with more efficient ones.

3.—To replace worn-out tools with tools of the same design.

All large progressive concerns expect to and generally do expand, either by increasing their business along existing lines of manufacture or along similar lines, and frequently this increase occurs so suddenly that immediate action must be taken in purchasing the necessary tools to take care of the extra requirements. When this condition arises, the purchaser must quickly decide what machines will be required, and endeavor to purchase those that can be delivered promptly and which will do the work intended in an efficient and economical manner.

General Purpose Tool Feature.

It is often found, however, that while the machines offered for prompt delivery will perform the work desired in a satisfactory manner from a time standpoint, they are also designed and equipped to do a still larger class of work, and if installed the investment is greater than it should and would be for the work intended, if time would permit the installation of special machines. The fact that the fully-equipped general purpose tools are valuable and a good investment both for the large and small manufacturer, when the work is brought through in small quantities and the machining requirements vary, has no doubt a tendency to encourage the machine tool builders in some cases to carry only as their standards fully-equipped tools (or nearly so) capable of doing a wide range of work, feeling that as long as this situation exists the demand will warrant such a policy and that it would not pay to carry a line of cheaper and simpler tools.

When machines are considered to take care of an anticipated increase in business and to improve manufacturng conditions by replacing existing tools, the purchaser generally has the time to give the proper attention to the design and character of the machines needed, and it is almost unnecessary to say that he frequently decides to instal special or single purpose tools when the machine tool builders have nothing else to offer but expensive general purpose tools.

Automobile Manufacture Tendency.

The history of the automobile business in regard to machine tool requirements, if reviewed, will show that, when the business first started, machine tool builders had no difficulty in selling standard tools for this service, but as the business reached a sounder footing and time permitted giving more attention to the methods of manufacture, it was found advisable in a great many cases to demand machines capable simply of performing particular operations, or similar operations to those for which they were intended.

This has prompted some machine tool builders so to design their tools that they can now supply not only this demand, but also the demands made upon them for tools equipped to do a wider range of work. The attention of the writer was recently called to an instance where this had been done in the redesigning of a horizontal boring and drilling machine so that it could be offered simply for boring operations, and not as a high-class precision tool. The machine was arranged with a reasonable number of changes in feeds and speeds, and as a jig would be depended upon for accuracy of the work and duplication of parts, the spindle of the machine merely acted as a driver and feeder. The machine was designed for either belt or motor drive.

General Product Tendency.

What has been said regarding the tendency of automobile builders in ordering tools is also true of other large manufacturing companies, but possibly not to so marked a degree, because their products are not so well standardized or defined. This condition was very apparent in placing about $100,000 worth of medium-sized machine tools in a new factory for a line of work which is manufactured in large quantities.

It was advisable for several reasons to provide direct motor drive for all of these tools, and an effort was made to do so, but it was soon found that this could not be accomplished with all the machines that were considered desirable to use on the work and could be supplied promptly. For instance, some of the engine lathe and milling machine operations necessary in this work are of a light and simple nature, which can be done economically on stud lathes or cone type millers; in most cases, therefore, the standard lines of motor-driven engine lathes and high-power milling machines were considered too expensive to instal, which, of course, prevented carrying out the idea of motor driving all of the tools as originally desired.

Standard or Fully Equipped Tools.

It can readily be seen that it is not generally considered desirable or profitable to use so-called ''standard or fully-equipped tools' on a line of standard apparatus. While it is appreciated that it is to the machine tool builders' interests to make their standard lines of tools serviceable for as many purposes as possible, in order to be able to meet the different requirements of a majority of their customers, they should also aim to make the designs so that the tools can be sold without the attachments and special features if not required for the work intended. They should either do this or else they should carry a line of machines of simpler design, which can be used on the general run of commercial work.

---

*From a paper read at the recent National Machine Tool Builders' Association Convention in New York.

**Director of manufacturing operations, The Westinghouse Electric & Mfg. Co., Pittsburg, Pa.

The User's Viewpoint.

Machine tool builders very often show machine tool users by time studies or actual demonstrations in connection with a special piece of work that the time taken can be lessened by the use of their particular tools, and in such cases from the machine tool builders' standpoint, there is no reason why advantage should not be taken of this gain. With the user, however, this is not the entire proposition, especially if his production will permit him to use the machine in question continuously on such a line of work, which is very often the case. Under this condition any special features or attachments other than those actually needed for the work in question are of no value to the user and on account of the high purchase value, the saving in time does not warrant the extra investment.

Cases of this sort are very common, and are discouraging to those endeavoring to be progressive by aiming to take advantage of some of the new machine tools offered, and while machine tool builders deserve a great deal of credit for the great advancement made in the designs of their tools for the purpose of producing work rapidly and accurately, it seems that in their efforts to do this they have overlooked the fact that in some lines of manufacture these tools are too expensive to use. Simpler designs embracing some of the modern features will often do just as well.

Typical Examples.

These points can probably be made clearer by referring to a certain machine the Westinghouse Electric and Mfg. Co. has found very useful for its needs, and of which it has about two hundred in operation. The builder of this tool has, however, more recently developed a fully-equipped tool with all of the modern attachments, making it very advantageous in some instances, but which naturally is higher priced. He intends to discontinue the manufacture of the old machine, yet it is very evident that, on certain classes of work, the older type is just as desirable, and on other classes, the advantage of the new tool is negligible, because of the difference in purchase price of the two machines. It would be to the interest of the user to have this old design of tool improved to some extent, and it would likewise be profitable to the manufacturer, without in any way discrediting the value to both parties of the new type of tool.

In another case, the machine tool builder in his effort to produce a simple tool for a certain line of work did not take advantage of some of the modern attachments which would have improved his tool from an operating standpoint. The changes in feeds were cut down to what was considered the required amount for the service intended, but to change the feed it is necessary to remove and replace change gears. It can readily be seen that a modern change feed attachment would have been far more desirable. The value of this machine to the user also could be increased if it were equipped with a rapid traverse for the carriage.

Another tool recently installed to improve the quality of work and reduce the cost, lacks a certain modern feature, which makes the machine more laborious and more expensive to operate, and it will have to be equipped with this attachment to meet the cost of doing the operation under the old method.

Motor Driven Tools.

The demand for motor-driven tools, especially by the larger manufacturers, is increasing as the value of the motor drive is becoming more fully recognized, but some tool builders do not seem to realize this fact, or to take it into account in their designs. Machine tools so designed that the only possible way to apply motor drive is by ceiling mounting and belting down to them, or by placing the motors on the floor some distance from the tools, are very unsatisfactory, and it is safe to assume that this type would not be considered if it were possible to find other machine tools to do the work which were better arranged for motor drive.

While this fault can be found with some machine tools of recent design, most of them, however, have been on the market for years, and in place of making them more suitable for motor application some builders have designed new lines of machines which are satisfactory as far as motor application is concerned, but which cost considerably more to instal on account of the greater number of parts or attachments and higher power features. These new types of machines have a broad field of usefulness and are profitable on certain classes of work, but they do not entirely replace the old type; it is obvious, therefore, that users whose policy it is to motor drive must either drive some of their equipment with belts, or else do work on expensive tools which could be done as economically on cheaper and simpler tools.

Co-operation of User and Tool Builder.

To show what may be accomplished by a combined effort on the part of the machine tool builder and user an instance may be given of a small hand milling machine which has been arranged for adjustable speed motor drive in a very satisfactory manner by widening the column of the standard machine to receive the motor, and driving direct to the spindle by means of a sprocket chain. Ventilation is secured through suitable openings in the column. A semi-dust-proof condition is obtained by covering these openings with a fine mesh wire screen. Saving in operating time and changes in speed are obtained by the use of a starting and speed adjusting rheostat so placed on the side of the machine that the operator does not have to change his position to start, change the speeds or stop the machine. This application requires no extra floor space, and it makes a self-contained portable unit which can be readily shifted from one location to another, making the tool available and desirable to those wishing motor application.

In making the change the tool builder was put to some additional expense, and the purchaser was charged accordingly for the first machines, but, on later purchases, the price was about the same as the regular charge for the standard cone type. This is very uncommon, however, as machines sold for motor drive generally cost more, regardless of the fact that the full value of the parts not required seems more than those added for motor application.

Speed Changing Features.

A few years ago it was not considered advantageous to motor drive planers, but now the adjustable speed reversing motor drive for planers is generally accepted as a decided improvement over the usual method of belt drive. This is merely mentioned to call attention to the possibility of eliminating some of the mechanical speed changing features of other equally important machine tools by the use of the adjustable speed motor, and in so doing, of obtaining a more satisfactory range of speeds. On some types of machines, the speed-changing features can be omitted without altering the designs to any great extent, but this is not true in all cases, clearly showing that adjustable speed drive was not considered when designing them.

In conclusion, it may be said that on commercial lines of work, the operations and methods are so planned that the operators are only required to perform a single operation, and can, therefore, be graded accordingly. It is not good policy consequently to use highly improved machine tools capable of doing a wider range of work than the operators are called upon to do, but the machines should be equipped with any automatic features which will decrease the skill necessary to operate them, or which will reduce the cost of performing the required operations.

MACHINE SHOP METHODS AND DEVICES

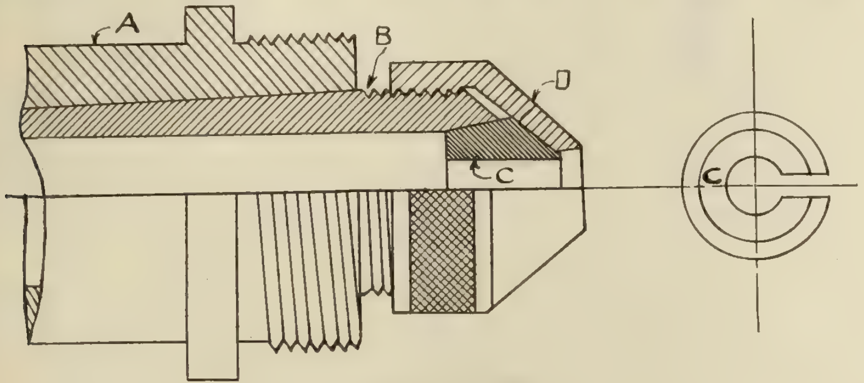
Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

MAKING A PULLEY WITHOUT A PATTERN.

THERE are various kinds of pulleys and there are many ways and means of making them. It is generally a question of selecting the best of the rigging at hand. I am not speaking of course, of shops where they form part of the regular output, but of the ordinary jobbing shop where occasional orders come in.

One of our boiler shop pulleys broke recently, and it became necessary to make a new one, as soon as possible. The old man came along in a great hurry and said he wanted it right away. "I don't care how you make it," said he. "You can put in any kind of hubs, arms or ribs; only, have it 11 ins. dia., and 22 ins. face, and bore out for a 2 3-16 ins. shaft.

I took a scout round the pattern storage and found a piston ring 11½ in. diameter outside, 10 in. dia. inside, and 6 in. deep; an old face plate from a lathe about 15 in. dia., and a hub off another pattern 5 in. dia. and 5 in. deep, with an 1¾ in. print. The patternmaker bored a hole in the face plate to take the pin in the hub, then nailed four blocks on to keep the ring central, also 4 shallow 2 in. prints to take distance or thickness cores on the webs. I used this rig first as a core box and made 4 cores, two with the hubs and prints for distance cores, and two plain ones, these latter were struck out to a thickness of 4¾ in. so that when the whole core was assembled it would make a total length of 23 in. While these were drying, I laid down a drag, struck it off level, laid on the piston ring pattern, rammed up the outside, and kept on drawing it until I had 23 in. depth.



SMALL CHUCK.

When the cores were dry I lowered the first one containing the hub into position with a piece of twine, slung barrel fashion, put in the 1¾ in. centre core—the 4 distance cores having been pasted in at the core bench, then lowered on the two plain cores which had already been pasted together, with the vents all leading to the print for the next 1¾ in. centre core. This latter, which had a large vent hole through it, was next put in, and the top hub core lowered into place. This last core had runner, riser and vent hole through the top to carry off the gas from the cores underneath.

The core being flush with the top of the mold I covered the rim with pieces of paper, put in the runner and riser pins, laid an 8 in. bushing on the core, put on a shallow frame and rammed it up. I then laid a flat strap across the top, slipped in wedges between strap and bushing and clamped the whole thing together and poured the job.—J. C. T.

Small Chuck.

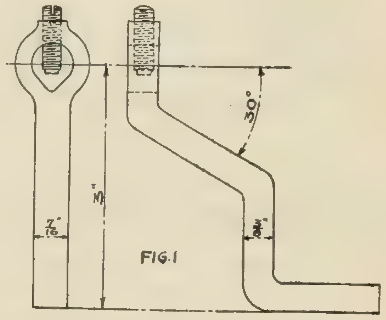
A very handy tool for an engine lathe is the small chuck here illustrated. (A) is the lathe spindle, (B) the hollow spindle of the chuck, (C) the split ring, which must have an angle of 40 degs. at front and 10 degs. behind, and (D) the knurled locking nut.—W. Womersley.

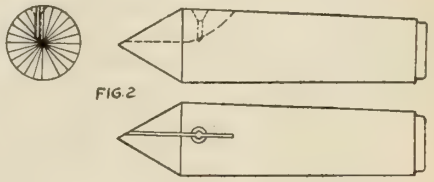
Small Lathe Dog.

The sketch, Fig. 1, shows a dog well adapted for small and short lathe work. The advantage in having the tail bent, as shown, lies in the fact that the usual shaped tail does not allow the carriage to be brought up as close as is very often required on small work. A ¼ inch 24 thread headless set screw is provided to fasten the work.

Lubricating a Lathe Centre.

I recently had occasion to make some engine lathe dead centres. It was then that I conceived the idea for lubricating them without drawing from the work. This was accomplished in the following manner:—After turning the blanks, I cut a 1-32 inch wide saw slot, 1-16 inch off centre, as shown in Fig. 2. A recess was then formed for catching the drops of oil by countersinking. After hardening and grinding, it was deemed advisable to remove the sharp edges on the saw slot, this being easily done with a fine oil stone. A few drops of oil squirted into the countersink recess served to keep the centre and work well lubricated for a considerable length of time.





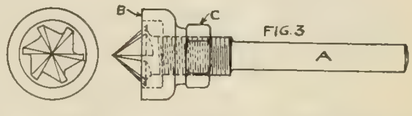


FIG. 1. SMALL LATHE DOG.
FIG. 2. LUBRICATING A LATHE CENTRE.
FIG. 3. A GAUGING COUNTERSINK.

A Gauging Countersink.

For countersinking large numbers of holes to a uniform depth the tool shown in the sketch, Fig. 3, suits the purpose admirably. It comprises the following parts. The countersink (A) is shown with a portion of the shank threaded to receive the stop (B), which is prevented from shifting its position by means of the lock nut (C). All parts with the exception of the lock nut are hardened. It hardly seems necessary to go into further details.—Chas. Hattenberger.

Ink Bottle Support.

The sketch, Fig. 1, illustrates a very simple and useful attachment for an ink bottle to prevent it being upset. It is made of strong cardboard cut in a circular shape, with radius (A) equal to three or four inches, and fitted about the bottle neck. The joint is secured by small paper fasteners, so that the bottle may be replaced.—W. A. P.

FIG. 1

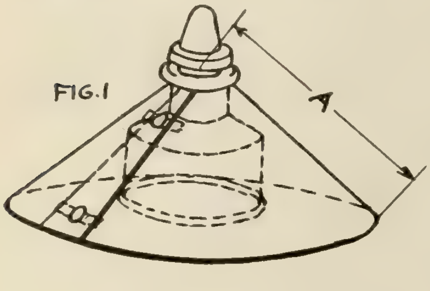

FIG. 2

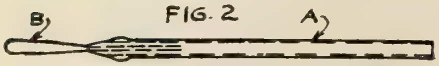

FIG. 1. INK BOTTLE SUPPORT.
FIG. 2. SAFE AND HANDY INSTRUMENT.

* * *

Safe and Handy Instrument.

Most machinists know how difficult it is to extract a splinter of wood or steel from the nervous eye of a workmate, also that the sooner it is extracted the better. The instrument, Fig. 2, not only makes the operation practically painless, but eliminates the serious danger of injuring the eye. It consists of a small brass or copper tube (A), which is flattened on an inserted very fine steel wire (B) bent in a loop. Thus, the wire loop forms a smooth end, by which loose particles may be removed from the eye. A coarse hair from the padding of a coat serves as a good substitute in case of emergency.—W. A. P.

* * *

Accident Prevention in Railroad Shops.

The matter of the prevention of accidents in roundhouses and railroad shops has received considerable attention from railroad authorities. It is recognized that while the training of the human element is as important in shops as elsewhere, yet at the same time physical conditions also merit consideration. There are four main sources of accidents in shops:—First, unguarded machinery; second, insufficient light; third, flying particles, and fourth, obstruction of passageways. These things can be properly attended to and increased safety can be obtained. Safety devices can be installed for the safeguarding of machinery; sufficient light can be provided and windows and electric lamps can be kept clean; the employees can be equipped with goggles to prevent injury of the eyes by flying particles; and passageways can in a majority of cases be kept clear of obstructions. The matter of oversight also enters largely into the prevention of accidents. If the foreman or superintendent in charge of the shop is thoroughly impressed with the necessity of accident prevention, he will find numerous ways of preventing injuries that might otherwise occur. The following are some of the precautions which employees in shops and roundhouses should observe:

Don't wear loose, baggy clothing in working around moving machinery.

Don't walk on railroad tracks, and before crossing any track "Stop, Look, Listen."

Report all unsafe conditions and practices to the foreman or other person in charge.

Explain fully to your helper the proper methods of work. A little time spent by a mechanic in imparting instructions to his helper may save one or both an injury.

Never jump on moving cars or engines. This is a risk which no shopman is required to take and which he cannot afford to take.

* * *

Bending Kinks.

I introduced these kinks into a crane-making shop. Previously all levers and rods were bent in the vise with cumbersome bending irons and levers. A great amount of time was wasted in taking down the job and walking to the vise. Fig. 1 shows a device for bending eccentric rods, levers, etc., without taking down the members. It is only necessary to slip the strap over the bar, adjust it, and drive the key into place. The screw can then be turned with an ordinary wrench. The key can be backed off slightly, and the strap slipped along the lever, if more than one operation is needed to properly bend or straighten it. With this arrangement it is possible to make short bends and work in restricted places.

Another arrangement is shown in Fig. 2. This is easily adjusted for bending in either direction, it being only necessary to reverse the block. The key is detachable. A particular point of merit lies in the fact that it can be used without disconnecting the eccentric rod, and in case of emergency it can be used as a blade twister by placing a piece of iron under one edge of the block.—W. Womersley.

P. A. Peterson, for many years chief engineer of the C.P.R., died November 21, after an illness extending over ten years, Mr. Peterson was born at Niagara Falls seventy-four years ago, and received his education at University of Toronto, where he graduated with the degree of B.Sc. He was president of the American Society of Civil Engineers at one time, and was also one of the few Canadian members of the British Association. He built a large part of the Intercolonial Railway, and was connected with the construction of a part of the Canadian Pacific. He retired ten years ago from the position of chief engineer of the C.P.R.

GENERAL INDUSTRIAL GOSSIP

A Review of Developments in the Industrial World which Make for Higher Degree Achievement along Economic Lines Through Concentration and Conservation of Effort

MACHINE TOOLS FOR ELECTRICAL MACHINERY PRODUCTION.

''A. E. G. Journal.''

SOME 20 years ago, an electrical machine with an output of 1,000 h.p. was regarded as a curiosity. The construction of large machinery had then made very little progress, and it was impossible to conceive that in a short time the manufacturing of electrically driven rolling mills, winding machines, large gas engine dynamos, water turbines and other similar machines would furnish an almost unlimited amount of work for the electrical engineering industry.

When the A. E. G. built its large machine shops in the Brunnenstrasse during the year 1896, with their 14 bays, and installed a 20-ton crane for transporting the large machine parts, which was 8 metres in height, and had a span of 14 metres, these works were looked upon as the most modern of their kind. It was impossible to foresee at that period that at the end of a very short time this building would no longer meet requirements. Nevertheless, even two years ago it became necessary for the A. E.G. to decide upon the erection of a special building for the manufacture of very large machines.

Building and Equipment Features.

This building, which is of great height, is constructed with a steel framework on the triple-jointed arched girder principle. The main stays and girders are filled out, which imparts a very attractive appearance to the structure. The roof is constructed almost exclusively of glass, so that all parts of the building are flooded with light. The hall is 140 metres in length at the present time, and is to be extended later to 200 metres. The effective crane height is about 15 metres and the span 30 metres.

The new hall is therefore double the height and double the width of the old building. It contains 3 crane runways one above the other. On the main runway there are two 75-ton cranes. Below them are bracket cranes having a lifting capacity of 5 tons, for transporting light material. Finally, motor-driven jibs with a lifting capacity of 2 tons are mounted on the main columns. Even the largest and heaviest parts of machines for reversing rolls, large water turbine and gas-engine plants can be transported from place to place with ease in this enormous building. The exceptional dimensions of the hall were essential, as machines with outputs of 10,000 kw. and parts weighing 100 tons are handled daily at the present time.

No difficulty is experienced in handling even the largest parts. The framework of the large machines projected above the crane runway in the old shops, and had, therefore, to be dismounted for transport, whereas the entire machines can now be lifted and turned in one piece.

Tools Brought to the Work.

The new shops are equipped with the most modern machinery. As the transportation and fixing or centreing of the large castings always entails a great loss of time and expense, the opposite method of procedure is now adopted; the work itself is moved as little as possible, the tools being brought to it. This system also possesses the advantage that it is possible to work with a number of machine tools simultaneously.

For example, while holes are being drilled on the exterior of a stator by two or three machines, a slotting machine may be working at the same time on the inside, producing the slots. When these operations have been concluded, the work passes on to the next process —namely, that of turning. For this purpose the heaviest, strongest and largest lathes constructed at the present time are available in these machine shops. They permit even the largest stators and rotors to be placed on the faceplate and turned in one piece.

''Shavings'' is scarcely the correct term for the waste material here; the iron is literally torn off in blocks by the turning tools. On lathes of this kind, a rotor which formerly took 3½ weeks to turn, can now be completed in three days.

Mechanical Coil Winding.

In order to avoid the frequent insulating and lacquering work necessary when winding by hand, which occupies a great deal of time, large machines for voltages of 6,000 volts and more are now provided exclusively with coils manufactured mechanically. The winding machine winds the coils layer by layer with scrupulous accuracy. All interstices between the windings which might lead to the generation of ozone or oxidation of the wires—that is, to the destruction of the insulation, are obviated by impregnating the coils at a high pressure.

Testing the Product.

After the poles have been turned and mounted, the rotors of the water turbine generators are placed in a speed testing pit armoured with gravel and concrete, and are tested to an excess speed of 80 per cent., thereby ensuring absolute immunity against explosion when the machine is erected on site. These water turbines run normally at a speed which is perfectly constant. A certain amount of foreign matter which is unavoidable at high water, such as stones, bits of wood, etc., gets fixed in the regulators, notwithstanding the use of screens and gratings. The turbine and generator will then get out of control if the load is taken off suddenly. The excess speed test is carried out with a view to this possibility. By these means any faults in the material are discovered in the factory and therefore no injury can be caused to persons or property by the rotor flying to pieces after the machine has been installed.

All machines are manufactured with the assistance of modern arrangements, each part is carefully checked, and finally each machine, including the largest, is tested at full load on the test bed, after which the finished machine can be taken to its destination.

WORKMEN'S COMPENSATION IN ONTARIO.

AFTER over three years' study of the question of workmen's compensation, which matter was placed in his hands by the Provincial Government on June 30, 1910, Sir William Meredith has presented to the Lieut-Governor-in-Council, an exhaustive report, in which he makes recommendations, furnishes reasons for them, also arguments for their adoption by the Legislature.

Features of the Report.

A Government Board will administer the law.

So long as disability lasts, compensation goes on.

Railway companies do not contribute to the accident fund.

Contributory negligence no bar to compensation.

Ontario Government will make contribution to compensation fund.

Compensation for managers, no matter how highly paid, is limited to $2,000 a year.

Board will have final decision as to disposition of reserve fund.

New Act is founded on the German law, and is said to be the best in the world.

Under the new Act, workmen are defended against unscrupulous employers.

An injured man may be granted compensation without litigation.

Board's decision is final, but Crown may state a case for opinion from Appellate Court.

Accidents and industrial diseases are on the same footing.

Employers must share expense of administration.

Crown is not included in Act, but will call on board in case of accident to Government employes.

In the case of "wilful or serious misconduct" no compensation will be paid unless death or serious disability results.

Common law, in so far as it allows an employe to take upon himself risks in connection with his employment, is declared unfair and is abrogated.

Navigation and telephone companies must commute weekly or periodical payments to their employes, and keep their workmen insured against accidents.

The Act does not, at present, include in its scope wholesale and retail establishments, domestic servants or farms, but the board is empowered to bring them in when it sees fit.

Under new law, workman suffers loss of wages for 7 days, if disability does not last longer; outlay for medical treatment; loss of 45 per cent. of wages while disability lasts; employer is called on to pay 55 per cent. of injured party's wages while off duty.

Reciprocity in Boiler Inspection.

To avoid any possibility of their boilers being penalized in the way of pressure allowed, the firm of Baldrig, Yerborough & Hutchinson, of London, Eng., who have secured the contract for Section No. 2 of the Welland Canal, have offered to pay the traveling expenses of a Government inspector to England and back, so that any boilers found under standard may be replaced. It is not likely that the Ontario Government will do this, as the boiler inspection staff have plenty of work to do at home. The provincial boiler inspection regulations only came into force on July 1, so that there are scores of boilers in Ontario waiting to be inspected. It is work that requires doing immediately, as three recent serious boiler explosions prove. Up and down the province there must be a large number of boilers which have passed their useful stage, and are not fitted to stand the steam pressure being used. The boiler in the Manley Chew sawmill at Midland, Ont., which exploded last month and killed two men, was one of them.

It is very hard to see the necessity of sending a Government inspector to England to inspect boilers so that the contractors may save the expense of sending inadequate ones out. It is safe to say that if they pass the test of the British Government they will pass muster in Ontario. It would be a dangerous precedent too. Another firm might want to send a Government inspector to Siberia, which would be just as reasonable. Some day there may be reciprocity between the Mother Country and the Dominions in this matter, when a boiler which can be operated at 95 lbs. pressure in Great Britain will be permitted to do the same in Canada. Something along that line is being planned now in Canada. Mr. D. M. Medcalf, chief boiler inspector of Ontario, has been instructed by his Minister to communicate with the Departments in other provinces to have their representatives meet in Toronto in January, to discuss the question of interprovincial reciprocity in boiler inspection.

Moving Pictures of Steel Plants.

A moving picture is being shown in Canada just now, illustrating the manufacture of steel. Patrons of the "movies" are taken through the various departments from the furnace to the rolling mills. Incidentally all this is used as the basis for a tragedy. It is not likely that any more steel will be used as a result of this picture, yet this is the medium chosen by German iron and steel manufacturers for pushing trade in foreign countries. An organization has been formed, and special efforts are to be made in China and the Far East, so as to overcome the hold of Great Britain and United States. Films illustrating the achievements of German industry in most graphic style are to be shown in connection with lectures in the native tongue of each particular district. These are certainly novel lines on which to push the steel industry, but no one dare predict for what purpose the moving picture will be used next.

Must Use Smoke Consumers.

Montreal, like most large manufacturing cities, is troubled with smoke from factories. Mr. O. E. Champagne, city boiler inspector, following a suggestion made by the grand jury, has recommended that a by-law be passed which will make it compulsory for householders as well as factories to use anthracite coal and smoke consumers, instead of soft coal. There is a city by-law already which makes it compulsory for factories and works of all kinds to use smoke consumers, and attention is now being turned to residences and apartment houses. The Board of Control have referred the matter to the legislative committee.

Farewell to a Machine Shop.

Some may think there could be no romance in a machine shop. To the man who has worked in one building for over thirty years, its dirty walls and worn-out benches become almost sacred, and to leave them is like leaving the old home. There are many such shops in this country—shops that sent out the machines that served Canada years ago, but which in the twentieth century are inadequate and sooner or later must give way to the forward march.

The boiler and machine shop of the A. R. Williams Co., Toronto, has been serving a useful purpose for over half a century. It is situated near the waterfront, and must be demolished to make way for the new Union Station. The occasion could not be allowed to pass without some ceremony, so the two oldest employees, Merti Shea and Stephen Crute, who have been employed in this shop over thirty years, were given the honor of driving rivets in the last boiler made there. As this took place, the wrecking crew of the Grand Trunk Railway stood around, ready to begin the demolition of the building. Among the officials of the A. R. Williams Co. present were: A. R. Williams, T. A. Hollinrake, and F. W. Kischel. Fifty years ago, these shops were occupied by Dickie & Neil, makers of boilers and machinery, and were known as the Soho Machine & Boiler Works. Thirty years ago they were taken over by the A. R. Williams Co., who have recently built a new and up-to-date establishment in Lake Street.

Tests on Rope Drives.

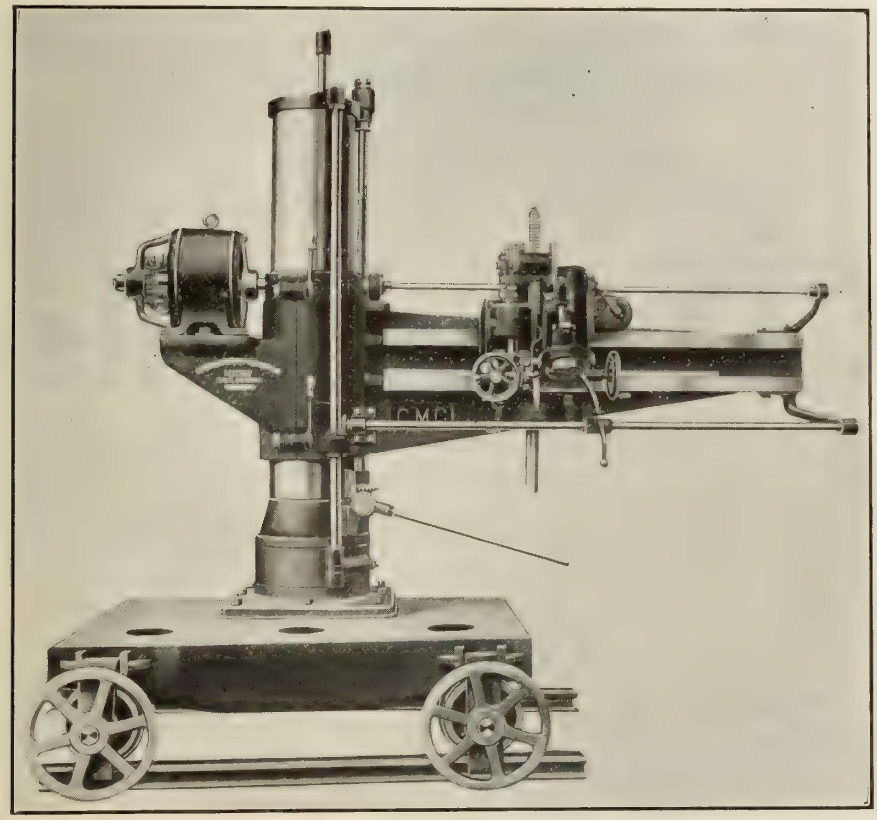
A paper read in the United States describes tests on rope drives under widely varying conditions. Efficiency is highest at the lower speeds, and decreases most rapidly at speeds greater than 4,500 feet per minute. Span between centres has little effect on efficiency until spans greater than 150 feet are used. The American system of driving gives higher capacity and efficiency than the English system when conditions are suitable for its adoption. If care be taken in erection and in jointing of ropes there is no reason why multiple-rope driving should not be as efficient as single-rope driving. The results are plotted in curves, and show for the American open drive an efficiency of 93 per cent. within a wide range; for the English open drive the efficiency decreases linearly from 91 per cent. to 85 per cent. as the speed increases from 2,300 feet per minute to 5,600 feet per minute. The English open drive appears, according to the paper, to be unsuitable for spans of more than 100 ft. because the upper slack part sinks down and may rub on the ground.

DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

RADIAL DRILL FOR BRIDGE WORK.

BRIDGE and structural engineers particularly have been interested in the new bridge across the St. Lawrence above Quebec, and in the shop specially designed and erected at Lachine, near Montreal, for building this huge piece of work in Canada. The equipment throughout has been special and suitable to the conditions demanded by the size of the parts and the material used. Our illustration shows one of a lot of 40 radial drills supplied by the Canada Machinery Corporation, Ltd., Galt, Ont., to the St. Lawrence Bridge Co. These machines were specially designed for the work, and contain many features of note.



RADIAL DRILL FOR BRIDGE WORK.

The drill is of the radial type with a 76 in. arm and round column. Sixteen of the drills were arranged for mounting on a floor plate and the remaining 24 were provided with trucks as shown on the illustration; these trucks having wheels to run on a standard gauge track, to be moved along as the work requires. Arrangements have been made for clamping the truck rigidly to the rails, and a prominent feature of the design is the ease with which the truck may be unclamped, moved to a new position and quickly clamped in place again.

The drills have been provided with a direct connected motor mounted on the arm, and driving the drill spindle through spiral gears and an intermediate shaft. This gives an exceedingly direct and strong drive and one possessing several good features.

The bearings with the exception of the guide bearings of the spindle itself, are all of the full ball bearing type, and the spiral gears are made from high carbon steel and bronze, totally enclosed with a large grease cup for lubrication. The motor is of the variable speed type with a range of speed sufficient for the work required, so that no change gears have been provided in the drive.

The feed is of the all-geared type with four changes, and is also provided with a quick return and slow hand motion. The controller handle of the motor travels with a carriage, enabling the operator to start and stop or change the speed without leaving the carriage. The locking of the arm is done by means of the handle travelling with the carriage, this being a great convenience when working at the end of a long arm, as the operator does not need to leave the carriage for each adjustment.

The machine under test has drilled 1 3-16 in. holes from solid high carbon steel at the rate of 10 in. per minute, and owing to the ball bearing equipment, a very high proportion of the horse power from the motor is delivered to the spindle.

30-IN. RAPID REDUCTION LATHE.

THE description and illustrations refer to a new machine recently developed at the Pond plant of the Niles-Bement-Pond Co., for the heaviest kind of roughing work, such as is required in steel and forge shops. It is of massive, powerful construction, steel gears being used throughout. Some idea of the strength and power of this machine may be gained from the fact that it is provided with a 35-H.P. motor, which will deliver to the tool about 26,000 lbs. pressure at 50 feet per minute. With 19 ft. bed, the net weight of this machine, including motor, is 25,600 lbs.

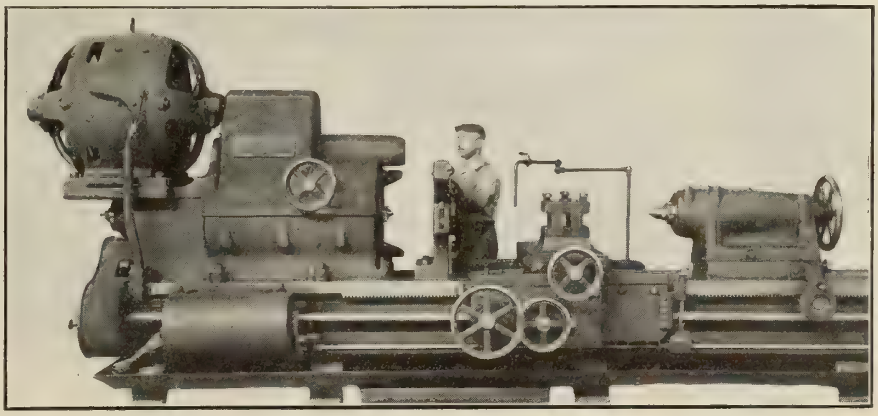


FIG. 1. FRONT VIEW OF POND RAPID REDUCTION LATHE.

For the First Time in a Quarter of a Century Comes a Marked Improvement in the Making of Twist Drills

Wilt Twist Drills are made by an entirely new process:—

A process that machines the entire tool in a single chucking—thus insuring a degree of accuracy that is well nigh impossible under old-fashioned methods where five or more separate chuckings are necessary.

The material goes in one end of the automatic machine —the drill comes out of the other.

Wilt Twist Drills

Are Made In Canada

They are made of the highest grade steel that can be bought.

They are machined with absolute accuracy and uniformity.

The contour of the grooves is scientifically determined—to produce maximum cutting efficiency,

The clearance is machined to a nicety that insures maximum working capacity and freedom from binding.

Accuracy and uniformity to a degree not possible hitherto are insured by the patented automatic machine process under which Wilt Twist Drills are made.

Hence we say to you in all sincerity — "You can't afford to delay a practical trial of these remarkable drills."—

You are cordially invited to write us concerning your drill requirements.

Wilt Twist Drills and Reamers are Scientifically Hardened in an Electric Furnace

Nothing is trusted to chance or guess-work.
The heat is regulated to an exactness that is not possible in any other type of furnace.
Every drill is given the precise degree of hardness necessary for the work it is intended to do.
There is perfect uniformity here as well as in the designing and machining.

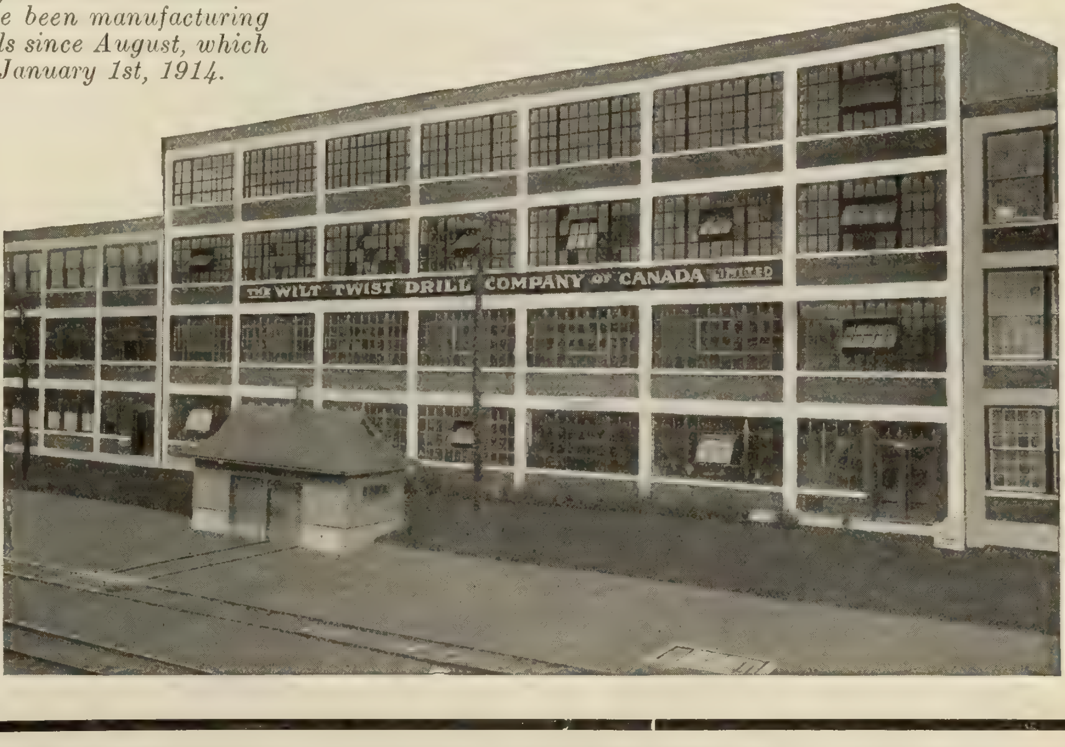
Wilt Reamers

Are made with the same exactness and under the same scientifically controlled conditions as the Twist Drills. They are probably the highest type of reamers ever produced — the most efficient — the most uniform in quality and grade.

Service and Quality are our watchwords. To this end we have been manufacturing a large stock of drills since August, which we will put on sale January 1st, 1914.

After January first, 1914, you should be able to get Wilt Twist Drills and Reamers from any jobber or dealer in Canada. If you are not supplied promptly write direct to the manufacturer.

Let us send you the Catalog.



The Wilt Twist Drill Company of Canada, Limited

Walkerville, Ontario

A. D. Wilt, Jr., President
J. Harrington Walker, Vice-President
H. A. Springle, Sec'y & Treas.
F. C. Thrall, Manager

The spindle is driven through suitable gearing by a direct connected variable speed motor mounted on the head stock. The motor pinion and gear which it drives have herringbone teeth, insuring quiet operation. Two mechanical changes of speed can be made in the headstock by convenient lever. The lower speeds of the face plate are obtained by means of a pinion driving the face plate gear. The design is such as to eliminate any tendency of the resistance of the tool or of the power applied to the pinion to lift the main spindle in its bearing. The bearing caps are relieved of the upward thrust due to the cut. The higher speeds are obtained by driving direct through the face plate spindle, thus obviating the necessity of running the face plate pinion at an excessively high speed. The end thrust on the main spindle is taken by large hardened steel and bronze washers. The gearing in the headstock in connection with the variable speed motor gives 40 face plate speeds from 13 to 174 r.p.m. By means of a handle on the carriage, the faceplate may be started, stopped, reversed or any of the wide range of motor speeds obtained without requiring the operator to leave his position at the carriage. The face plate is of steel, and is fitted with radially adjustable drivers.

All of the rotating shafts in the headstock are mounted in bronze lined, self-oiling bearings with large oil wells. All of the bearings and gears are entirely enclosed and furnished with a continuous supply of oil from a tank in the head. This tank is kept filled by a general pump, drawing oil from a tank in the bed into which all surplus oil drains. The oil is filtered before using again.

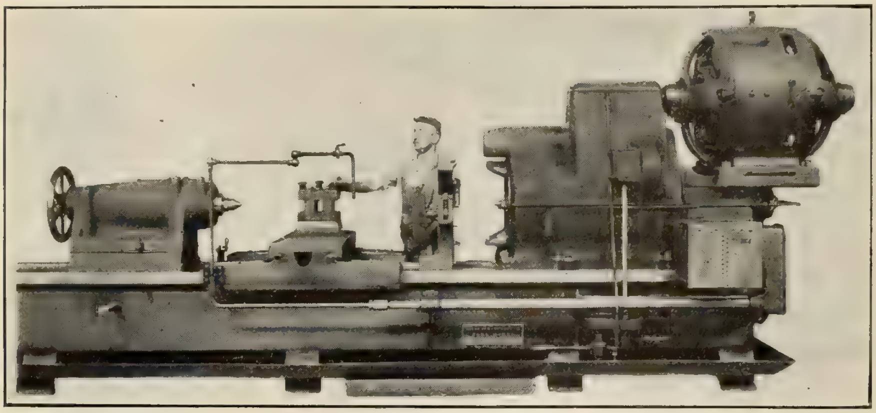


FIG. 2. REAR VIEW OF POND RAPID REDUCTION LATHE.

The tool carriage has a bearing on the bed for its entire length front and back. It is gibbed underneath the track, both inside and outside. The edges of the carriage are raised, and drains are provided to prevent the lubricant from running on the floor. The drainage surface is below the tool slide guides, all of which are protected from chips and water. The tool slide travels on a wide bridge of such length that the sliding surface on the carriage is not uncovered when turning the largest diameters. The tool block or carrier is secured to the top of the tool slide by four heavy bolts and cross key. It has two open side slots and one closed central slot, large enough to receive tools $1\frac{1}{4}$ in. x $2\frac{1}{2}$ in. Each tool slot is provided with a hardened serrated plate and three clamping screws.

A large stream of cutting lubricant is supplied by a geared pump of ample capacity, located at the head stock. Telescopic piping mounted on the back of the bed conducts the lubricant to the tool carriage from which it returns to a tank at the head end of the lathe.

The apron is of substantial, ribbed box construction. The feed gear shafts are supported at both ends, and all rotating shafts run in bronze bushed bearings. The centre rest is of heavy, rigid construction, and is provided with three adjustable jaws with large wearing surfaces.

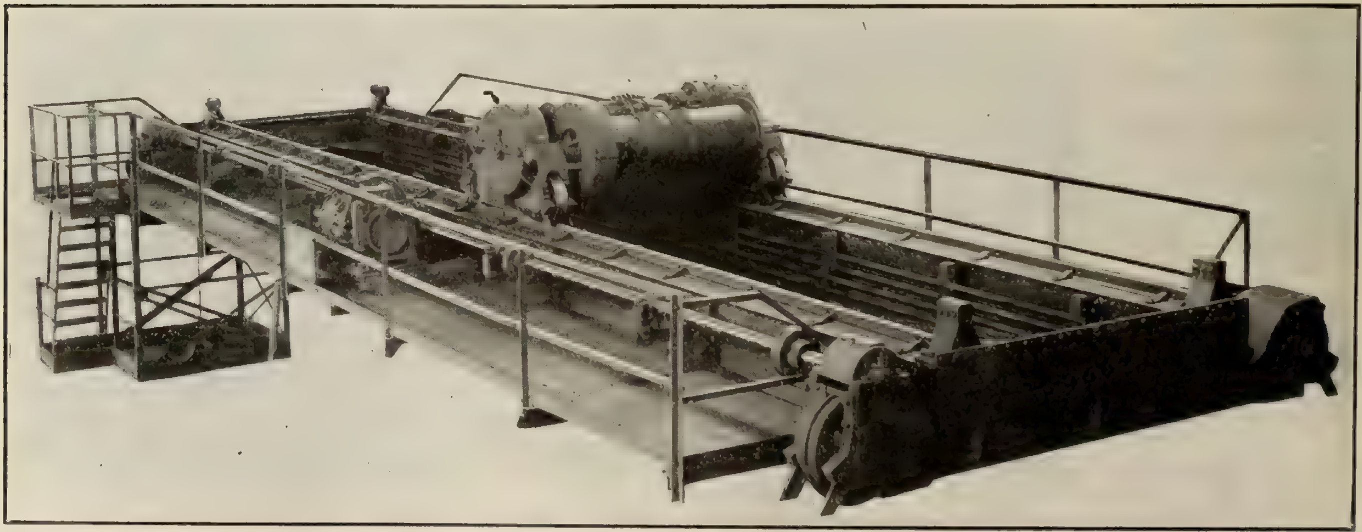
The tail stock is especially massive and rigid, but is readily moved by gearing engaging the steel feed rack. It is provided with a graduated setover for small tapers. The tail stock can be rigidly clamped to the bed by four large bolts, and a tail brace engages a rack in the bed, preventing the possibility of slipping under heavy loads.

The bed is very wide and deep, and has wide flat tracks tied together at short intervals by heavy box section ties. The bed is mounted on short legs in a deep steel pan which entirely surrounds the lathe, and extends beyond the sides a sufficient distance to prevent the cutting fluid dripping on the floor. The pan is also mounted on short legs, providing space underneath for a wheeled tank at the head end for collecting the lubricant.

◆

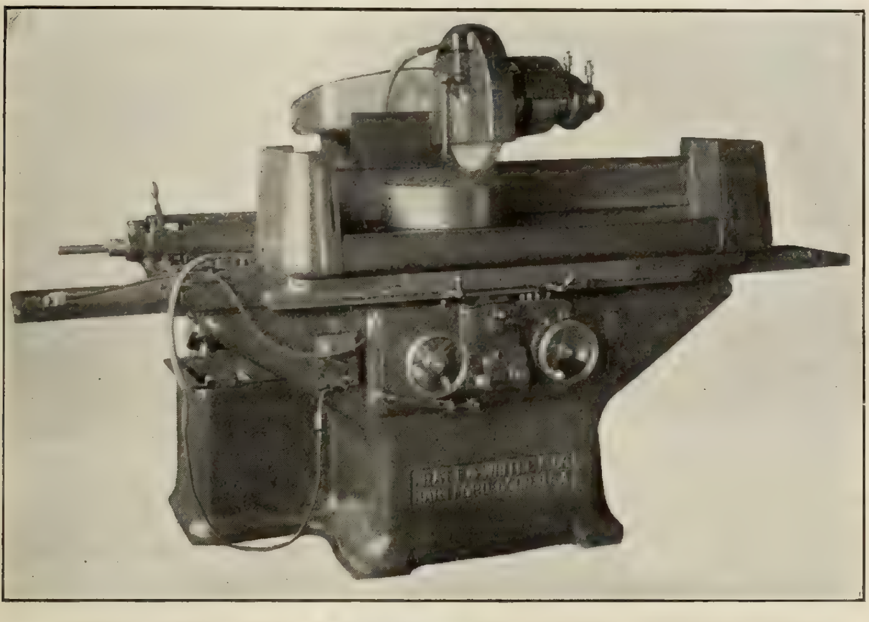
10-TON HEAVY SERVICE MILL CRANE.

THERE is illustrated and described herewith a 10-ton mill crane designed for heavy service and built by the Northern Engineering Works, Detroit, Michigan. A number of novel fea-



10-TON HEAVY SERVICE MILL CRANE.

tures are to be found embodied in this specialty. The crane is of steel construction, steel castings being largely employed. The bridge footwalks are of steel with checkered floor plates, while the bridge end trucks are M. C. B. type heavy steel castings, with safety guards in front of all wheels and safety drop lugs under the trucks.



FRONT VIEW, PRATT & WHITNEY DISK GRINDER, SHOWING CONTROL MECHANISM.

The trolley is built along the lines of "Northern" patented type (E) design, adapted to heavy mill service, and has a cast steel frame and cast steel girt. The intermediate reduction gearing is run in a gear pocket cast into the trolley side, connecting the back geared motor with the drum gear. When especially high speed designs are used, the motor back gear is used as the only intermediate gear, making a two reduction design. Mill motors are used and the bridge is equipped with bar conductors attached in the most approved manner. All wiring is in steel conduit.

Trolley wheels have guards in front of them, and all trolley bearings are of capped type with split bushings. Trolley axle bearings are all M.C.B. type, with steel waste pockets. The entire trolley has safety pan underneath. The cage is of extra large size with outside steel staircase leading to footwalk. There are no overhanging gears and no open gears on the whole crane. An extra large safety factor is used, while automatic limit stop for hook, automatic electric brakes and dynamic brake are among the other features.

The crane is built to conform to the standard safety specifications of the Electrical Mill Engineers, supplemented and modified by the special specifications of the mill of one of the large steel firms in the Pittsburgh district for which the crane was built. Several cranes of similar construction and larger capacity have since been ordered by the same interests.

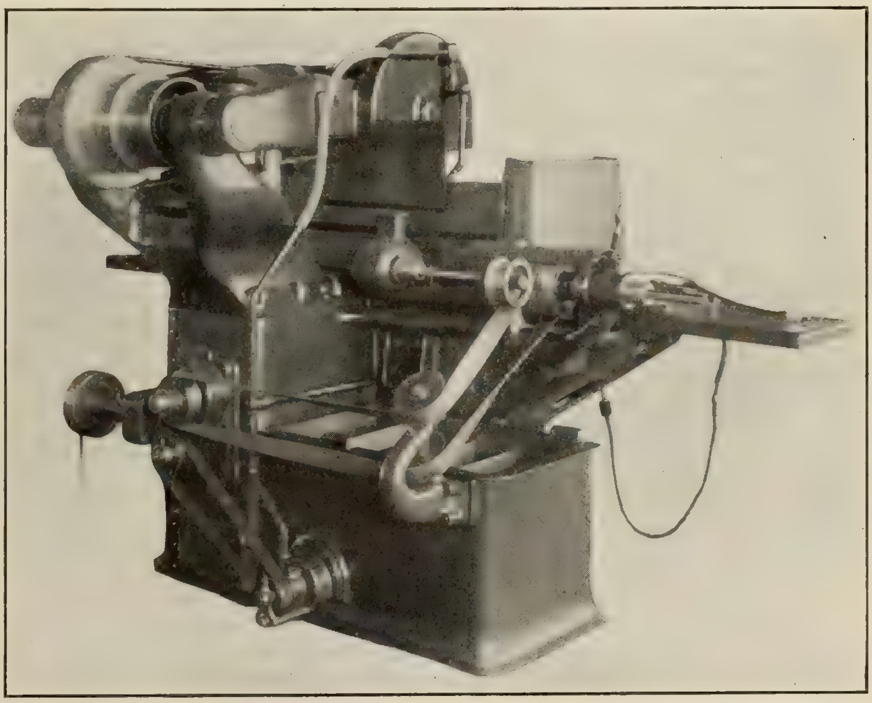
The Northern Crane Works, Walkerville, Ont., are the Canadian branch of the Northern Engineering Works, of Detroit.

PRATT & WHITNEY DISK GRINDER.

THERE are certain classes of work finished by grinding, in which it is preferable to have the finish lines circumferential, instead of having the radial lines which result from the use of a cupwheel. To meet the requirements of such work, and especially for circular grinding where the surfaces to be ground are at various heights, the Pratt & Whitney Co., Hartford, Conn., has brought out a new grinder, front and rear views of which are here illustrated. This machine has also been found very satisfactory for grinding thin hardened disks, as there is relatively little heat generated during the grinding processes, so that the work may be finished without distortion. Another application is the grinding of large piston rings and similar classes of work, the large wheel used on this machine handling such pieces without perceptible wear.

The bed, table and table feed mechanism are similar in design to the 14-inch vertical surface grinder of this Company's manufacture. The machine is adapted for using a large size wheel, which is adequately supported and powerfully driven. The wheel is mounted at right angles to the work and provision is made for delivering a liberal supply of water during the grinding operation. The bed is massively proportioned and internally braced in a manner that insures ample rigidity and permanent alignment; it is of compact design, and the various units are located in a way that makes them easily accessible. Wide bearing surfaces of the vee and flat types are provided, and oil reservoirs for automatically oiling the ways are located in the bed. The pan which surrounds the rear of the bed for collecting the water and chips is of liberal proportions and easily accessible for cleaning.

The table is of heavy construction and powerfully ribbed to prevent warping and resist torsional strains. The table is



REAR VIEW, PRATT & WHITNEY DISK GRINDER, SHOWING WHEEL SUPPORT AND ARRANGEMENT OF DRIVE.

slightly longer than the bed and the traveling action keeps the bearings perfectly true. Guards are provided at each end of the table, which cover the bearings and protect them from injury, and a pan is cast integral with the table for controlling the water. The work-holding problem is simplified by the use of a rotary magnetic chuck which forms part of the equipment of this machine.

The table is provided with an automatic reciprocating motion, the desired length of stroke being obtained by means of adjustable table dogs. The table feed mechanism is designed as a simple and compact unit, which is easily accessible. Two table feeds are provided, both of which are instantly controlled by means of a lever located at the front of the machine. When adjusted to the central station, this lever serves as a means for stopping the table; when placed in the upper position, the slow feed is engaged; and when located at the lower station, the fast feed is brought into action. The table is driven through a vertically located rack and pinion, the construction being such that the possibility of vibrations—commonly called ''tooth marks''—showing in the work is eliminated.

One of the important features of this machine is mounting the wheel on an arm, which entirely eliminates the use of a slide construction. The arm is accurately fitted on an arbor, which, in turn, is supported by an upright at the rear of the machine. Both the arm and arbor are of ample proportions to insure absolute strength and rigidity. With this construction, the wheel is supported without overhang, and the control of the vertical wheel feed is also made a simple matter.

Referring to the rear view of the machine, the arrangement of this method of supporting the wheel will be readily apparent, and it will also be seen that the arm has a liberal bearing upon the arbor, the bearing surfaces being dust and water-proof. Both hand and power vertical wheel feeds are provided. The feed mechanism operates a screw, which engages the under side of the arm upon which the wheel is mounted, thus adjusting its position as desired. Both the elevating screw and nut are of liberal proportions and made easily accessible; the power feed is obtained by means of a ratchet wheel and pawl, which act in connection with the elevating screw. Provision is made for automatically disengaging the power feed, and the feed may be accurately gauged by means of a large dial, the periphery of which is graduated to thousandths of an inch. The feed operates at the end of each stroke when the wheel is entirely clear of the work.

The wheel spindle is made of tool steel, fully heat-treated, and then ground and lapped to obtain the highest possible efficiency for this important member. The bearings are bronze bushed and mounted in conical seats; being made and located in such a way that they are easily accessible for adjustment and absolutely dust and water-proof. Particular care has been taken to obtain proper lubrication, large self-feeding oilers being provided for this purpose. The wheel-mount is self-contained and constructed in a way that insures having the wheel held securely and perfectly true. The end of the spindle is made conical to receive the wheel-mount, which is positively driven by means of a key.

The machine is designed to use wheels up to 18 inches in diameter by 2 inches in width, but suitable packing rings are provided to permit the use of wheels down to a face width of 1 inch. The wheel spindle drive is of liberal proportions, so that there is no question as to whether the wheel will have power for the most severe classes of service for which the machine is intended. Two speeds are provided by means of a two-step cone pulley so that when the diameter of the wheel is reduced by wear, its speed may be proportionately increased.

It is well known that in order to keep a grinding wheel cutting freely and to prevent the work from heating, a liberal supply of water is absolutely necessary. This point has been given careful attention and the pump used is made and located in such a way that it entirely dispenses with the use of the customary type of idler pulleys. The pump is capable of delivering an abundant supply of water, which is drawn from a tank located at the back of the machine, where it is readily accessible for cleaning. The water is returned to the tank without being carried through pipes. The pipe through which the water is conveyed to the wheel is attached to the guard and may be quickly adjusted or removed according to the requirements of different classes of work. Both the table and wheel are provided with guards to prevent water from being thrown onto the floor.

◆

To Overcome Factory Fatigue.

More and more attention is being paid to the welfare of the workman, not only from a humanitarian point of view, but from the standpoint of dollars and cents. In Germany, various engineering works have found that it pays to provide rest rooms for employees, so that older and experienced men especially may retire at convenient periods, and return to their work better fitted. Everybody knows that a man's efficiency drops to a low level after working continuously for five hours. Several firms in Ontario, who have given this matter thought, have adopted various schemes for overcoming fatigue. In Guelph, we believe, hot coffee and rolls are delivered from a central depot to the various plants in that city at a very cheap rate. Frank B. Galbraith, who has made a scientific study of fatigue of workers in stores and factories, speaking before the Engineering Society of the School of Science, Toronto, on November 13, stated that if a workman could only sit down for five minutes every half hour, the gain would be inestimable. Failing this, he should be taught to rest his weight on one foot, and then on the other. There was no reason, he said, why a man should stand all day if he could perform the same work sitting down. Mr. Galbraith told of a factory where, owing to the revolving of shafts, the floor had a continuous vibration. The fatigue suffered by 300 girls employed on that floor was 100 per cent. eliminated by putting springs on the legs of their chairs. He did not advocate the elimination of fatigue altogether; in fact, he would have men be so tired when they got home they would require their dinner brought to them; but this fatigue should be caused by accomplishment, and not by waste of energy. Mr. Galbraith's idea of teaching a man to carry his weight on one foot sounds amusing at first thought. There are some machinists so intent on their work they could not be induced to sit down. On the other hand, there are clever mechanics who are equally industrious, yet not half as strong, who would benefit by a rest at certain periods. The street railway companies realize this, and supply seats for motormen who have non-stop runs. Dr. Hastings, the medical health officer for Toronto, will inaugurate a system next year for the medical inspection of factories. Its chief features will be: Regulation of temperatures in work rooms, conveniences for scrupulous personal cleanliness, and a plentiful supply of pure drinking water.

◆

Pigeon, Pigeon & Davis, Patent Solicitors, St. James Street, Montreal, report that 133 Canadian patents were issued for the week ending November 4th, 1913, 84 of which were granted to Americans, 21 to Canadians, 19 to residents of Great Britain and Colonies, and 9 to residents of foreign countries. Of the Canadians who received patents, 8 were residents of Ontario, 5 of Quebec, 3 of Manitoba, 3 of British Columbia, 1 of New Brunswick, and 1 of Prince Edward Island. In the United States for the same week, 719 patents were issued, 9 of which were granted to Canadian inventors.

TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada To Achieve and Maintain a Dominant Place in the Markets of the World.

British Market for Canadian Cars.— A new departure in the Canadian car industry is likely to result from the visit to England of Hon. Nathaniel Curry, President of the Canadian Car and Foundry Co. by which Canadian cars may be shipped to Great Britain to compete against the home product. Up to the present time, a market has been provided in Canada for the entire output of the Canadian Car & Foundry Co., but with the completion of the new plant of the company at Fort William, and the increased production at the old plants, a market abroad is now being sought, to take care of any surplus that may result. It was pointed out by an official of the company a few days ago, that with the completion of the Fort William plant, the Western business would be pretty well looked after, and that this would leave the company free, and with ample time in the east to look after the foreign business. While on the face of it, the export of railway cars to Great Britain looks like a pretty big problem, it was pointed out that cars could be shipped "knocked down" to very good advantage. Flat cars would be shipped intact. Box cars and stock cars would be shipped "knocked down," and passenger cars would be first put together here, and then marked and taken apart, so as to be put together on the other side with but slight cost. It is felt by the officials of the Canadian Car and Foundry Co. that the Canadian concern would receive the preference in the British Colonies on this business, and a strong bid is to be made for it during the next few months. Cars could be shipped direct by steamer from the Amherst N.S. plant, as well as from Montreal.

The Evil of Bonusing.

It will be interesting to watch the effect of a new law being introduced into Saskatchewan, to prohibit the bonusing of industries. Hitherto it has been customary all over Canada for a town to attract new factories by what is virtually a bribe. This takes various forms; sometimes it is the loan of a large sum, or an exemption from taxes, or a free site, and sometimes the bribe includes all of these. Often the effect has been to place a lame concern on the backs of the ratepayers. Then, such a policy had a disturbing effect on manufacturers. A town would make an offer to a firm in an adjacent town to move their plant, promising them a bonus in return. A case of this kind is reported from Levis, Que. The city of Sherbrooke is alleged to have offered a firm of boot and shoe manufacturers in the above town certain concessions if they would move their plant to Sherbrooke. As the concern in question is one of the main supports to Levis, considerable bitterness has resulted. Another effect of the bonusing system is to be seen in the action of old established concerns asking the town in which they are located for the same favors as are being given to incoming industries. An instance of this is attracting attention in a town on the Pacific coast. A large industry has threatened to move to another town if its ground rent is not reduced considerably. As the firm in question is contemplating an extension, efforts are being made to satisfy them. It must be admitted that such methods are not satisfactory, and Hon. George Langley has taken upon himself the task of amending the Town Act of Saskatchewan, so as to prohibit the granting of exemption of taxes or a free site. Nothing is said about the granting of loans and the guaranteeing of bonds. If such a law were introduced in Ontario, it would have the effect of sending industries to towns where they were best suited, and would stop this wild competition now going on between various cities.

Technical Education Delayed.

The Toronto Globe published a startling despatch from Ottawa last week to the effect that the Hon. T. W. Crothers, Minister of Labor, had authorized the statement that he had summarily stopped any further payments to Dr. James Robertson, Chairman of the Royal Commission on Technical Education, and to Thomas Bengough, secretary, and had ordered immediate completion of the Commission's recommendations for establishing a comprehensive system of technical education and industrial training throughout Canada under Federal grants. His present desire is apparently finally to wash his hands of the Commission and its report. The Globe's story is denied by Conservative newspapers, who, however, add that Hon. Mr. Crothers has been dissatisfied with the lack of expedition in completing the report. Mr. Crothers certainly has had a long while to wait to learn what is required in the way of technical education in this country. We do not believe he has any intention of shelving the subject. It is one of the most vital necessities of Canada, and if it is delayed much larger, there will be a loud outcry heard from people interested. Until some big move is made in this direction, Canada is in the rear in the matter of education. Outside of a few large cities, there are practically no facilities for the son of a workingman to secure a technical training.

Not Time to Tender.

A British firm wrote to the Hamilton Board of Control last week asking that tenders be advertised a month in advance of the letting of contracts, as the short time now given did not permit of British firms tendering. The city engineer advised the Board that changes had frequently to be made in plans, and it was often impossible to advertise for tenders a month ahead. He suggested that firms in other countries who did not have a representative in Canada should do without the business, as it was found more desirable to treat directly than by letter. Eastern manufacturers in Canada often have cause to make the same complaint against Western municipalities, who give two weeks at most in which to tender for supplies. A case in point occurred recently. Victoria, B.C., advertised tenders for a large amount of steel pipe and for a telephone line in connection with the Sooke waterworks. The contracts are important ones, but tenders had to be in by November 24, whereas they were only called for two weeks ago.

Quebec Bridge on Barges.

The Quebec Bridge will shortly reach the stage attained several years ago when it collapsed and killed scores of employees. Plans have been prepared by the St. Lawrence Bridge Co., Ltd., for erecting the main span, measuring 1,800 feet in length. This will be divided into three sections, two of which will be built out from the north and south main piers, measuring 580 feet each in length, while the centre piece, measuring 640 feet, and weighing 6,000 tons, will be built on five floating barges, and floated from the Levis side of the river to a place where it can be drawn into position. These barges will be built ready to be used next season. The sub-structure of the bridge, which has been in the hands of M. P. and J. T. Davis, is now completed.

QUEBEC ARSENAL SCANDAL.

A DEPLORABLE state of affairs has been found to exist at the Quebec Arsenal. Last summer an investigation was held, presided over by Col. Sir H. W. W. Barlow. As a result of developments, the superintendent, Colonel Gaudet, has been retired, and Major Lafferty put in his place. It has been found that whereas ammunition was supposed to be made to Woolwich standard gauges, not a single Woolwich gauge was to be found in the institution. An effort was made to salvage six or seven million .303 bullets and brass cases ready for loading, but without success. All must be scrapped. Another twelve million rounds were condemned by the Barlow Commission, and ordered scrapped. It was found that 1,500,000 cartridge case cups were not up to standard, and had to be melted down. In this case, the first operation in the manufacture of the cups had been performed wrongly because the machinery did not run true. Over 160,000 steel clips of simple design, were found to be useless, not having been made according to specification.

Another unpleasant development was found in the shell factory. This department was organized three years ago, and has never yet produced a shell correct to dimensions. The machinery for turning out these projectiles is found to be in such poor condition that it will take a long while to put it into shape again. Of the 8,000 shells in stock, the Barlow Commission recommended that such as were nearly correct to dimensions should be tested and salvaged if possible. On examination, not a single shell could be found that was properly shaped. The monetary loss in this department alone will probably exceed $100,000. It was also discovered that no stock-taking had taken place in the arsenal for thirteen years, and a discrepancy of $15,000 between the quantities shown in the stores account of the general ledger was found. No proper bookkeeping system was introduced until 1900.

If Canada is unable to make shells, she will find it difficult to make warships. It is a ten to one bet that the conditions above related do not exist at the Ross Rifle factory, also in Quebec. No concern could exist for a month with such rottenness. It is another case of politics interfering with industry. Evidently the Quebec arsenal was started badly, and has been badly managed since. If the Government cannot make shells profitably and accurately, they should hand the business over to a private concern who can. In view of the fact that much of the machinery in the Arsenal was found out of order, it would be interesting to know how many expert machinists are employed there, whether they have had any experience at this class of work, and how many employees in the Arsenal secured their jobs through politics.

✲

ACCIDENT PREVENTION.

THE conservation of human life, whether from the "snuffing-out" or health-maintenance point of view is a movement which has developed and progressed rapidly, and, to-day we find it in the very forefront of every domestic, social, municipal and political propaganda. While the necessity for practical and effective effort in the direction indicated has all along existed, it seems strange that a realization of the enormous waste, of the untold suffering and of the consequent wretchedness should have been so long in actively expressing itself.

That, the awakening to existent conditions is largely attributable to the inception of the efficiency movement, there is not the shadow of doubt, yet the scope and purpose of accident prevention and conservation-of-life-effort is both infinitely greater and higher in ideal than its birth source. Men are being given a new outlook in life, and are being made to feel their individual importance. It is true that we can each be done without when the "call" comes, but it is equally true that until then we have a place to fill, and that it is up to each of us to fill it, not carelessly or indifferently, but alertly and diligently.

✲

THE Board of Directors of the Canadian National Exhibition, Toronto, have decided to build a new Machinery Hall, with direct railway facilities for handling heavy machinery. A new site will be secured, and the old Machinery Hall used for other purposes. Plans are being prepared by Geo. W. Gouinlock, Temple Building, Toronto.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, Nov. 24, 1913.—Trade conditions still rule on the dull side, though the machinery business is perhaps a trifle brisker than it was last week. The announcement contained in a Canadian Associated Press cable to-day that only 52 per cent. of the $3,500,000 six per cent. five-year note issue of the Dominion Steel Corporation in London had been subscribed by the public did not create a great deal of surprise, although there was some expectation that, as the underwriting went so well, the public issue would meet with better success. The failure of the public to take more kindly to the issue makes no direct financial difference to the Steel Corporation, but Mr. Plummer would no doubt have welcomed a stronger testimonial of confidence. It is recognized, however, that industrials cannot expect to do as well as the higher grade municipal offerings in a market like the present, and that the Steel outcome was about as good as could have been expected. It is understood that Mr. Plummer is on his way home.

The season of navigation being now practically at an end, the prices for Scotch and English pig iron have been materially advanced this week. Of course, consumers have laid in their winter supplies by now, and present quotations are merely nominal, there being very little business done in these brands during the winter. Canadian and United States pig iron remains very dull, with no present prospect of improvement.

The steel situation remains unchanged. Conditions in Canada are rather better than in the United States, and that is the best that can be said. Although common bar iron is still being quoted at $2.10 f.o.b. Montreal, this price can be cut to $2.05 for large lots.

The copper situation is peculiar. Prices are still falling, and the producers seem to have failed so far in their efforts to establish a market, buyers apparently considering the price still too high. Tin remains unchanged, but lead is a little easier this week owing principally to the smelters at Trail, B.C., having resumed deliveries.

Toronto, Ont., Nov. 25, 1913.—The cuts in the prices of steel which were expected have not taken place. The only remarkable fall this week is that in the price of scrap and metals. Most scrap iron and scrap steel is $1.25 and $1.50 cheaper this week than last. Local business from warehouse for finished steel is standing well generally, although the mill business is not good. Deliveries range from four weeks to three months. Cutting of prices by outside steel concerns, who only enter this market when business is depressed, has ceased. It seems they have come to their senses, and are now doing their utmost first to get inquiries.

Prices of finished steel from the mills remain unchanged. The warehouse prices quoted in Canadian Machinery this week for steel bars and shapes are low, and are for big business only. Steel bars are being sold in smaller quantities at better prices. Mill prices for steel bars, f.o.b. Toronto, have been quoted at $2.10 for some time. As in many cases only $1.90 is being secured, our quotation has been reduced to $2.05. This seems to be an average price for steel bars in Toronto.

Motor Business Poor.

Jobbers and structural men are not buying finished steel and iron just now, owing to the proximity of Christmas stocktaking. With most of these firms stocktaking is a big contract, and means that a good part of the staff have to be laid off temporarily. Manufacturers who feel the depression the most just now are the stove people and automobile firms. The latter are not buying, and it is said that only one firm of automobile makers has bought steel in the last six months.

The shipbuilding and boiler concerns in Toronto are kept fairly busy with Government orders, which have been rather plentiful of late. The Polson Iron Works and the John Inglis Co. both received nice contracts last week. The Collingwood Shipbuilding Co. are also busy.

There is little demand for wire, but the nail business is fairly good. The reduction last week in the price of wood screws did not result in better business. The Swansea branch of the Steel Company of Canada is now working six days a week.

Boiler Plate Cheaper.

Boiler makers and other manufacturers will be interested to know that a reduction has taken place in the price of boiler heads and plates. Quarter-inch plates, which were $2.30, are now $2.20. The quotations for tubes are correct, though these are being shaded slightly when business warrants.

Machine Tools.

There is considerable movement just now in the market for contractors' machinery and supplies owing to the contracts having been awarded for the Welland Ship Canal. The Dominion Dredging Co. have already let their contract for equipment. Inquiries have been coming in during the past week from the Canadian Dredging Co. for prices on machinery. They must have been pretty sure of getting the contract for Section No. 5. This was awarded to them yesterday. Their contract price is about $2,000,000. Only one more section remains to be put under contract.

The number of machine tools disposed of by agents is small. Quite a number of firms are equipping, but are either not buying just now, or are purchasing only second-hand tools. The Canadian Fairbanks-Morse Co. sold a 25-ton gantry crane this week to the T., H. & B. Railway for their unloading yards at Hamilton.

Metals.

The most remarkable upheaval last week took place in the metal market. Prices came falling down in all lines, but the result is not an improvement in business. There is neither buying nor selling. Readers should compare this week's prices with those of last week to realize how prices in old material and metals have changed.

Lake copper, which was $15.25, is now $14.75. These prices are, of course, for carload lots. Tin, which was $41.50, is now $40.00. All scrap copper is down a dollar per cwt. The only scrap metals holding up at all were new brass clippings and No. 1 brass turnings. The drop has been taking place all week, and there is every indication that prices will drop further.

St. John, N.B., Nov. 22, 1913.—The fall business in the industrial section of the Maritime Provinces may be said to be most encouraging. Orders on new goods are heavy, and many plants are running extra time to complete shipments. In Halifax and St. John much interest is now being evinced with regard to the opening of the winter port season, which always means increased orders in stocks and repairs to the various machine plants, foundries, etc., and this year the belief is that with the increased sailings and the larger amount of trade looked for, the machinery firms will reap considerably more benefit than heretofore. A great deal of construction work, which has been in progress for some time around the harbor front in each city is now being rushed to completion—that is, what was scheduled to be finished in time for the winter port season of 1913-1914. Thousands of dollars have been expended, and are being spent still in this connection at both Halifax and St. John.

Although many have wondered at the rapidity with which the work on the new sugar refinery of the Atlantic Sugar Refineries, Ltd., has been going on in St. John, the contractors say they have not been doing as well as might be the case were they not held up for steel supplies. Structural steel deliveries have been slow, and owing to the lack of material, it was necessary to lay off some of the employees for a time.

The execution of the lease between the Ford Motor Co. of Canada and Hon. Wm. Pugsley for the acquisition of the new factory buildings of the Maritime Motor Co. at Coldbrook was completed this week. On or about December 1 the Ford people are expected to take up their location at Coldbrook. The new buildings which they will occupy are up-to-date in every detail, having been constructed of concrete and brick at a cost of upwards of $70,000.

An amalgamation has taken place with regard to the St. Croix Soap Manufacturing Co. of St. Stephen, N.B., and their extensive plant at that place, in that they have joined forces with the Associated Industries of England. The company is being taken in at a valuation of two million dollars. There is a possibility that the refining process may be carried on at St. Stephen, not only for the St. Croix plant, but for the other Canadian plants which have become factors in the amalgamation also.

Application has been made at Fredericton for the organization of the Atlantic Oilfields, Ltd., in which Albert Gregory, of Fredericton, is interested, with Captain von der Osten, a Berlin capitalist, as promoter. The company has acquired the rights from the Government of forty square miles of area in the vicinity of Sussex, N.B., and will develop this territory not only for salt, but for oil shale and gypsum as well, valuable deposits of which exist in the neighborhood. The new company is capitalized at $3,000,000, of which $1,000,000 is to be in 6 per cent. preferred and the remainder common stock. The promoters are cherishing the hope that potassium may also be found in the district, and, if so, potassium works will be established.

Frasers, Limited, are to have another new saw mill on the St. John River, and Swan Creek, near the northern line of Sunbury and Queen's Counties, has been selected as a site. The Company have acquired the rights to a large tract of land on which they will build their plant.

The Imperial Packing Co. of Woodstock, N.B., has been reorganized, with a larger plant and increased capital. The firm's production has been greatly augmented. E. R. Teed has been elected president, and Alfred Page, manager and secretary. The financial backing is strong.

The Smith Lumber Co. has built a new mill near by the plant of the Imperial Packing Co., and has a most up-to-date plant, while Major J. J. Bull, President of the Maritime Cooperage Co., in the same vicinity, says that their plant is to be materially improved.

It is said in Chatham, N.B., that the iron mines in Gloucester County will be operated as usual, and will not be closed because the Canada Iron Corporation is in liquidation. It is understood that Captain G. E. Corbett, of Annapolis, N.S., and A. J. Stewart, M.P.P., of Chatham, have had a conference with the Provincial Government, and that the former will continue the operation of the mines, taking out about 150,000 tons of ore each year.

The Dominion Coal Co. has agreed to give its miners increased pay. Since September last negotiations have been in progress regarding wages between the Company and the Provincial Workmen's Association. A new agreement to extend for at least three years has been entered into, whereby about 6 per cent. increase will be given.

ACCIDENT PREVENTION IN TEXTILE MILLS.

THE superintending inspector of factories for the Leeds, England, district has presented an agreement between representatives of employers, employees and inspectors concerning the fencing of machinery and the prevention of accidents in woollen and worsted mills. The report sets out in detail the points of agreement, and they include the following general provisions:

1.—On new machinery all projecting setscrews on continuously revolving parts shall either be countersunk or be otherwise efficiently protected; where projecting setscrews are placed inside box pulleys they shall be deemed to be efficiently protected. Projecting setscrews on existing machinery to be fenced unless safe by position.

2.—Ladders, other than stepladders, shall be fitted with hooks or other nonskid device; provided that in mule spinning rooms, or in rooms where persons work with bare feet, ladders shall not be fitted at the bottom with spikes.

3.—Heavy overhead main driving belts shall be guarded underneath in all cases where there is liability of persons having to pass under them.

4.—Fencing for all toothed wheels shall, as far as practicable, completely surround the wheel, so that there is no danger of any accident between the wheel and the guard itself.

5.—All representatives present were of opinion that it was most desirable that women and girls working amongst machinery should have their hair put up, or otherwise confined in a net.

6.—All firms are to be urged to keep a supply of sterilized dressings, which shall be kept available for first aid for any operative who receives a cut or wound.

7.—Cleaning machinery in motion was considered by all to be a dangerous practice, and should be avoided.

8.—Floors of machine rooms and stairs to be kept clean and free from grease as far as practicable.

9.—Periodical examination of machinery. Some person in each mill to be told off to examine, at least once a month, fencing of machinery and mill gearing, maintenance of proper temperature and ventilation, compliance with special rules and regulations, means of escape in case of fire, fire extinguishing appliances, and condition of the sanitary conveniences.

10.—Lifting of heavy weights. Children and young persons should not be required to lift weights which exceed for: Girls under 13 years, 16 pounds; between 13 and 14, 20 pounds; between 14 and 16, 35 pounds; boys under 13, 24 pounds; between 13 and 14, 30 pounds; between 14 and 15, 40 pounds; between 15 and 16, 50 pounds.—U. S. Consular and Trade Reports.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Berlin, Ont.—H. Nyberg will build an auto factory measuring 250x250.. Plans have been prepared.

Windsor, Ont.—The Ontario Steel Products Co. have purchased 3 acres of land, and will shortly erect a modern factory.

Chatham, Ont.—The Chatham Bridge Co. have built a new plant, and will be buying new equipment.

Walkerville, Ont.—Eastern Die Works, branch of a Detroit concern, have built and are equipping a factory for manufacturing dies.

Windsor, Ont.—The Detroit Steel Products Co. have purchased a site, and will erect a plant next to that of the Vincent Steel Process Co.

Sarnia, Ont.—The Sarnia Bridge Co. are understood to be making extensions, and are in the market for a considerable quantity of machine tools.

Deseronto, Ont.—The Standard Iron Company will spend $50,000 in improving and enlarging its plant if given certain concessions by the ratepayers.

Brantford, Ont.—The Adams Wagon Co. and the Brantford Carriage Co., both part of the Cockshutt Plow Co., have made extensions to their plant this year.

Hamilton, Ont.—Shapker, Anderson & Co., Chicago, have placed $1,000,000 worth of bonds on the market to finance the Hamilton By-Product Coke Oven Co.

Brantford, Ont.—The Hartley Foundry Co., Canal Rd., have recently built and equipped a 65x40 ft. addition to their foundry. They do local jobbing work principally.

New Glasgow, N.S.—The Maritime Bridge Co. have contracts for seven large bridges in New Brunswick, to be completed this fall, and orders for over 25 bridges in Nova Scotia.

Hamilton, Ont.—The Chadwick Brass Co. asked permission to build a switch across Birch Avenue to its factory, but this was refused. The company threatened to move but this made no difference.

Brantford, Ont.—The Waterous Engine Works Co. contemplate the extension of their machine shop lengthways and sideways. This will not likely take place until the money market improves.

Prince Rupert, B.C.—The Iron Mines, Ltd., has been organized here to work some hematite deposits near Hubert, B.C. John B. Rittenhouse, New York, has just completed an examination of the deposits.

Walkerville, Ont.—The Diamond Manufacturing Co. have leased two floors in the Power Building, and are equipping it with modern machinery for the manufacture of automobile wind shields, and radiator parts.

Prince Albert, Sask.—The ratepayers have granted 10 acres of land to the Royal Farm Machinery Co., Brockton, Mass., who will build a plant here, and employ 40 men. Work on the buildings has commenced.

Belleville, Ont.—The nine-inch mill at the plant of the Steel Co. of Canada, has made a record, turning out 91,015 pounds of light horseshoes in a day. This is said to be the biggest output made on a single turn in Canada.

Brantford, Ont.—Ker & Goodwin have built an extension to their shops, which will be used exclusively for making chucks, which is their specialty. The rest of the plant is for jobbing work. They will shortly be purchasing machine tools.

Windsor, Ont.—The Windsor Power Building Co. have purchased a site and will build in the spring a modern reinforced concrete building for the accommodation of small manufacturers. E. J. Post and W. J. Smales are behind the project.

Brantford, Ont.—The Pratt & Letchworth Co., makers of malleable iron castings, expect shortly to build a machine shop, for which they have purchased shaper, wet tool grinder and lathe. Among other equipment required are a milling machine and a drill press.

Brantford, Ont.—The Massey-Harris Co. is giving some of its work to the Verity Plow Co. to allow itself room for other work. The two concerns are closely related financially. All harrows will in future be made by the Verity Plow Co., and extensions will be made to the latter plant probably next spring, and new equipment including punches, shears, drills, bulldozers, etc., will be required.

Brantford, Ont.—Keeton Motors, Ltd., who have been making a six-cylinder car up to the present, will extend their equipment to produce a small model four-cylinder car, so as to turn out 750 cars between now and next June. Their new equipment will consist of machine tools, special tools and jigs. They are now adding a trimming and painting department. This is a branch of the Keeton Motor Co., Detroit.

Montreal, Que.—It is understood that the W. W. Butler Co., Ltd., incorporated at Ottawa recently to manufacture and sell railway apparatus, have taken over the business of the Canadian Gold Car Heating & Lighting Co., Ltd., 346 St. James St., Montreal, of which F. A. Purdy is manager. Preparations are being made for the manufacture of railway supplies here which were formerly made in the States.

Vancouver, B.C.—There seems to be something in the report that Yarrow & Co., shipbuilders, Glasgow, will erect a plant here. A. F. Yarrow, head of the firm arrived last week. Frank Yarrow and Messrs R. D. Keay and E. W. Izard have been here two weeks, and have made daily visits to the waterways, armed with blue prints and cameras, apparently collecting data to lay before their board of directors.

Woodstock, Ont.—The town will loan $20,000 for the consolidation of the enterprises of Isaac L. Mitchell, who has plants in Toronto, New Hamburg, and Woodstock, for the manufacture of cement machinery, and for the enlargement of the works here. The company will add probably about 35 men to the present average staff of 38 men here, and Mr. Mitchell will take stock in the company, transferring his patterns and patents.

Welland, Ont.—Foundations for the main building of the Electric Steel Co. are now being put in and erection will be proceeded with at once. The contract will go to the Standard Steel Construction Co., Welland. Only the main building, which is to be of brick and steel, will be put up this fall but the other buildings, including the offices, will be erected early next spring. The main building, 400x82, will cost in the neighborhood of $30,000.

Quebec, Que.—R. Ernest Lefaivre, liquidator, 98 St. Peter St., Quebec, will, on December 1, sell the following assets of The Canadian General & Shoe Machinery Co., Ltd., Levis, Que., now in liquidation:—Foundry tools, coppersmith tools, boiler shop tools, carpenters' tools, drafting room equipment, stock of iron, steel, pig iron, copper, rivets, etc.; office furniture, lathes, planers, drills, electric motors, hydraulic presses, milling machines, screw cutting machines, grinders, bending and welding machinery, shapers, electric drills, turret lathes, gas engines, etc.

Electrical

Kingston, Ont.—The city is purchasing new arc lamps for the streets.

Courtright, Ont.—This town will probably give a franchise to a natural gas company.

Winnipeg, Man.—The city will install ornamental street lights on both sides of Market Ave.

Quebec, Que.—The city will borrow $450,000, of which $125,000 is being used for providing electric lights.

Tilbury, Ont.—The town council has asked the Ontario Hydro-Electric Commission for a price on 250 h.p.

St. Thomas, Ont.—The light, heat and power department will spend a surplus of $8,000 on cluster lights. E. H. Caughell, manager.

Puslinch, Ont.—The Puslinch Council, meeting in Aberfoyle town hall, passed a motion in favor of Hydro-Electric power.

Montreal, Que.—The premises of F. Nicolas & Co., dealers in electrical supplies, were slightly damaged by fire on November 22.

Moosomin, Sask.—The town will probably make a contract with the Moosomin Gas Co., Ltd., to light the streets, for two years.

Victoria, B.C.—The Jordan River plant of the British Columbia Electric Co., has resumed operations, and is developing about 12,000 h.p.

Chatham, Ont.—The municipality will take steps to acquire the electric plant of the Chatham Gas Co. to be used as an auxiliary to the Hydro plant.

London, Ont.—Tenders have been called for the transformers to be used in converting hydro power into direct current for the street railway.

Toronto, Ont.—The Ontario Hydro-Electric Commission will call tenders for construction of the plant at Eugenia Falls, and for transmission lines.

Sudbury, Ont.—A deputation from Sudbury has asked Hon. Adam Beck if the Ontario Hydro-Electric Commission will develop 35,000 h.p. for the town.

New Westminster, B.C.—The Western Canada Power Co. have been granted permission to turn Stave Lake into a mammoth reservoir for generating power.

Kerrisdale, B.C.—The Ratepayers' Association will ask the council to submit a by-law in January to authorize the erection of a municipal light and power plant.

St. Catharines, Ont.—Kerry & Chase, Ltd., have applied for the contract of laying out and superintending the work of the hydro municipal lighting system in St. Catharines.

Davidson, Sask.—The Canadian Gas Producer and Engine Co., Barrie, Ont., have agreed to furnish the town with an electric light plant, and take $6,500 in debentures as part payment.

Lillooet, B.C.—G. Kent, a Vancouver engineer, has been engaged by the Lillooet Light and Power Co. to do preliminary work before extending the power plant.

London, Ont.—D. Guthrie and James Collier, representing West Oxford Township, have asked for estimates on power from the Ontario Hydro-Electric Commission.

St. Catharines, Ont. — Government engineers are engaged in surveying for the proposed big water main from Sugar Loaf to St. Catharines to supply lake water to all the towns along the canal in case the river and canal are brought to the same level.

MACHINE TOOL EQUIPMENT, G. T. P. SHOPS, PRINCE RUPERT, B.C.

John H. Guess, General Purchasing Agent the Grand Trunk Railway System, Montreal, will receive tenders until December 15, for the undermentioned machine tool equipment required for the Grand Trunk Pacific Railroad Shops at Prince Rupert, B.C. All tenders must be submitted in duplicate; all tools must be of heavy construction and suitable for ship repair work, and must be provided with 550 volt, 3 phase, 60 cycle alternating current motors complete with starting apparatus. Belt driven tools will include the necessary countershafts.

1—76-inch swing, triple geared engine lathe, single head, length of bed to take 50 feet between centers. Belt driven.

1—42-inch swing, triple geared engine lathe, with compound rest and taper attachment, bed to take 30 feet between centres. Belt driven.

1—24-inch swing, back geared engine lathe, bed to take 10 feet between centres. Belt driven.

2—18-inch swing, back geared engine lathes with compound rest and taper attachment, to take 6 feet between centres. Belt driven.

1—16-inch swing, tool room engine lathe, 6 feet between centers, compound rest, taper attachment, relieving attachment, oil pan, drawn-in collet, 12-inch four-jaw independent chuck, 9-inch three-jaw combination chuck, ½-inch drill chuck. Belt driven.

1—72 x 72-inch planer, 20-foot stroke, four heads, motor-driven.

1—24-inch stroke, heavy duty shaper, with vise and counter-shaft, belt driven.

1—72-inch full universal radial drill, with speed variator and tapping attachment, box table and counter-shaft, belt-driven.

1—30-inch upright back-geared, power feed drill, belt-driven.

1—26-inch upright, back-geared power feed drill. Belt-driven.

1—36-inch radial drill with tapping attachment. Belt-driven.

1—2-inch single bolt threading machine, with taps and dies, to thread ½ to 2-inch bolts. Belt-driven.

1—16-inch pipe cutting and threading machine with two die heads and interchangeable chasers cutting one and 1¼ to 6-inch pipe. Belt-driven.

1—Wet drill grinder with pointing attachment, up to 2½ inch diameter. Belt-driven.

1—No. 4 universal miller, complete with usual equipment, vertical attachment, and one set sample tools Belt-driven.

1—10-foot heavy boring and turning mill with slotting attachment. Belt-driven.

1—72-inch horizontal boring, turning, drilling and milling machine, 6-inch spindle, vertical movement of saddle on column and 6-inch traverse of column on runway fitted with automatic main feed complete with outer support for boring bar; bed plate 10 x 10 feet.

Hamilton, Ont.—The Hydro Department will decide between the lamps of the Canadian Westinghouse Co. and the Canadian General Electric Co. They have been installed on various streets for the test.

Merrickville, Ont.—A deputation recently waited on the Minister of Railways and Canals, and asked that the dam being constructed by the Government at Merrickville be made so as to permit the development of electric power.

London, Ont.—Hon. Adam Beck last week signed a contract with the London Street Railway Co. for the supply of Hydro power for the operation of the company's system. The London lines will require at least 1,000 h.p.

Victoria, B.C.—To provide a system of street lighting for four of the wards of the Municipality of South Saanich the cost will be about $37,500, according to an estimate submitted by the B. C. Electric Co., to the regular meeting of the Council. This provides for lights on 60 thoroughfares.

Ottawa, Ont.—The Michigan Northern Power Co., in conjunction with the Algoma Steel Corporation, has applied for approval of a scheme to divert certain waters of the St. Mary River at the Soo and develop power for the various industries on both sides of the international boundary.

Brandon, Man. — C. Chamberlain, representing the Great Falls Power Co., says his company will develop Silver Falls if given the city's order for power. His terms are: 1,000 h.p., at $40 per h.p. per annum; 1,250, at $39; $1,500, at $38; 1,750, at $37; 2,000, at $36; 2,250, at $35; 2,500, at $34; and so on down to 3,500 h.p. for $30. A conference of power users will be held.

Winnipeg, Man.—The National Construction Co. have applied for a permit to erect a power house for the Provincial Government to supply power to the Parliament Buildings, Law Courts, etc. It will cost $160,000. The boiler room will contain fourteen boilers. There will also be an engine room, workroom, fan room, and pump room. A smoke consumer will be installed.

Salmon Arm, B.C.—The power house was finished last week. Tenders were called for a 150 h.p. oil engine with direct connected 100 k.w. 2,200 volt, 3 phase, 60 cycle, generator, and exciter. The tenders were to include a four panel switchboard, consisting of one combined generator and exciter panel and three feeder panels, also a 12 k.w. series street lighting panel and constant current transformer. The successful tenderer for the engine was the Edmund P. Kay Co., representing the Swedish Diesel Co., and for all the other apparatus, the Canadian Westinghouse Co.

General Industrial

Sydney, N.S.—A number of city men have bought a site for a flour mill in Sydney.

Walkerville, Ont.—A roofing company have leased the old plant of the Walkerville Malleable Iron Co.

Toronto, Ont.—The Consumers' Gas Co. has issued a call for tenders for 750,000 worth of new stock.

Merriton, Ont.—The Riordan Paper Co. are installing a new water wheel in their mill. The plant is closed down.

Newmarket, Ont.—The town is making a loan of 15,000 to a clothing company, which will erect a plant costing $40,000.

Newmarket, Ont.—The council is negotiating with some manufacturers of ladies' clothing who purpose locating here.

Windsor, Ont.—A newly organized syndicate, to be known as the Windsor Milling Co., with capital of $100,000, has purchased from Wm. Orr the Orr Bros.' flour mill here for $30,000.

Regina, Sask.—The Downing Shoe Factory will open for business on December 10. The manufacture of shoes will commence about February 1, 1914.

Oakville, Ont.—Work on the plant of the James Langmuir Co., paint manufacturers, Toronto, which is being moved here, is nearing completion.

St. John, N.B.—The Atlantic Sugar Refineries, Ltd., have spent $453,557 on their new plant, and have asked the city to remit $20,000 of their deposit.

Edmonton, Alta.—Doulton's, the English pottery and terra cotta makers, have been looking over a field of clay recently discovered. J. A. Bonn represents them.

Toronto, Ont.—Bowes & Francis, contractors in reinforced concrete, with offices at 309 Stair Building, have assigned to J. P. Langley, with liabilities of $15,000.

St. Catharines, Ont.—The Consumers' Tire & Rubber Co. will erect a plant here in the spring. The capitalization is $400,000. This is the second rubber concern secured recently.

Levis, Que.—Messrs, Begin & Freres, tile pipe manufacturers, of Windsor Mills, Que., will erect a plant here, 160x60 feet, and pay $20,000 annually in salaries if given a bonus of $13,000.

Toronto, Ont.—Soren Brothers, tinware manufacturers on King Street west, have sold the factory which they erected on Claremont Street to a whitewear manufacturing concern for $30,000.

Saskatoon, Sask.—Christie Bros., Calgary, have bought the Sanitary and Hygienic laundries, and ordered three cars of new machinery, all electrically driven. They will generate their own power.

Sherbrooke, Que.—MacKinnon, Holmes & Co. have been unable to negotiate the issue of bonds for the erection of their new plant, and have asked the city to endorse tthem. They will spend $20,000, and will employ 50 to 100 men.

Charlottetown, P.E.I.—The City Council will grant to the promoters of a concern to manufacture woollen underwear, these concessions:—Exemption from taxation for ten years, and a bonus of $600 per annum for five years.

London, Ont.—Building operations have been commenced on the addition to the plant of the Taylor & Pringle Co., Ltd., pickle and aerated water manufacturers. The addition is to be completed for the commencement of the year 1914.

St. Catharines, Ont.—The factory of the United Rubber Manufacturing and Reclaiming Co. will be established in St. Catharines. R. J. Cluff, general manager of Steel & Radiation, Ltd., is president, and G. C. Rough, sales manager of the Packard Electric Co., is a director. Building will commence in April on a plant to employ 200 men.

Esquimault, B.C.—The B. C. Pottery Co. last week took out a permit for a three-storey structure of mill construction type. The cost of the building is $20,000. The contract has been let to Carkeek & Co., and the architects are the Geysbeek Engineering Co. T. G. Sedger is consulting architect. Completion of the building is promised in about sixty days, when some eighty men will be given employment.

St. John, N.B.—German capitalists, headed by Capt. Von Der Osten, of Berlin, have secured from the province government a concession of forty square miles near Sussex, N.B., and will prospect for salt gypsum ore, potassium and petroleum. The project is capitalized at three million dollars, and in particular the promoters expect to develop a big industry in potassium, which is known to exist in large quantities, and for which the United States offers an almost unlimited market.

Caledonia, Ont.—The contract was let a few days ago for the foundation work of the plant of the Haldimand Gypsum Mines Co., situated just outside of the western limits of the village. A meeting

Getting a Hold on Business

¶ That 1914 will open with a brisk movement in all lines of business seems to be the opinion of the majority of men whose opinions count.

¶ We are advised that conditions in the West are much improved, and there is tangible evidence that in the East trade in many lines continues brisk.

¶ There is an optimistic expression on the face of business in general, and, not later than Spring, we should see everybody happy again.

¶ During the past few months purchases have been somewhat curtailed on account of the financial stringency. Plant extensions in many cases have been postponed and only equipment to meet immediate requirements has been purchased.

¶ With the return of more favorable financial conditions, the demand for equipment will begin, and, owing to the period of temporary curtailment, will undoubtedly eclipse in volume all previous records.

¶ There is an effective method of getting a hold on this big business that is to be done in 1914, and you can get a line on it *now*. It is a method that has been employed successfully in the past, and is being used at present by leading manufacturers.

¶ It is a method that will start right in now and do sales work for you that will result in a splendid volume of business next year. It will do work for you that you could accomplish by no other means even at three times the cost.

¶ It is a method that works favorably on prospective buyers' minds just before—a few weeks perhaps, or a few months—big buying is to be done.

¶ This method is *ADVERTISING.*

¶ To advertise now in "Canadian Machinery," or any other reliable trade paper, is to give yourself an even chance with the most progressive manufacturers on the continent.

¶ To fail to advertise now is to be seriously handicapped in the race for business.

¶ It's much pleasanter going to the picnic on the excursion train than travelling alone. Set your advertising alarm clock to go off NOW. Don't shut it off and turn over for an extra forty winks. Manifest your intentions at once by dropping us a line.

Rate Card and full information gladly furnished.

Canadian Machinery & Manufacturing News

Canada's only Machinery and Metal Working Paper.
A weekly publication that thoroughly covers its Field.

143 University Avenue, TORONTO

of the directors was held, and all plans have been completed to rush this work, so that the erection of the mill can be carried on during the winter and the whole plant be ready for spring. It is expected that about 300 horse-power of Hydro-Electric will be taken from the village, and that about 100 hands will be employed at first.

Wood-Working

Midland, Ont.—Manley Chew, whose saw mill power house was wrecked recently by an explosion, will rebuild.

Hespeler, Ont.—Part of the Canada Woolen Mills have been leased from the Stamped Enamelware, Ltd., for a furniture plant, to be operated by Mr. Gotwell, Grand Rapids, Mich. David N. Panabaker will be manager.

Wiarton, Ont.—Fire from an unknown cause destroyed the $50,000 saw mill of Charles Pedwell at Lion's Head, entailing a loss of at least $28,000, insurance being placed at $12,000. Mr. Pedwell, head of the firm, stated that the mill may not be rebuilt.

Oakville, Ont.—Davis & Doty have started to erect a sash and door factory on a site near the new paint factory.

Trenton, Ont.—As it is thought the fire which recently burned the baby carriage factory was of incendiary origin, the Town Council have ordered an investigation.

Contracts Awarded

Salmon Arm, B.C.—Mayor Scales has arranged with the Municipal Construction Co., of Vancouver to complete the water works system.

New Westminster, B.C.—James & McClughan have the contract for four 2,000-gallon water tanks for the Government snagboat being built by the Coquitlam Shipbuilding Co.

Ottawa, Ont.—Macdonell & Dibblee, Montreal, have been awarded the contract for building a temporary bridge to replace Billings' Bridge. The tender of Shuttleworth & Black was $50 higher.

Vancouver, V.C.—The contract for building a passenger subway to the North Vancouver ferry wharf has been awarded to the M. P. Cotton Co., their tender being $30,105. Pumps will be required.

Montreal, Que.—The Dominion Bridge Co. have closed a contract for the steel work for the new 23-story Royal Bank Building, which is now under way at the corner of King and Yonge Streets, Toronto.

Moncton, N.B.—The management of the I.C.R. is making extensive preparations for the increased business expected this winter. Of the locomotive orders, fifteen go to the Montreal Locomotive Works, nine to Kingston, and five to Toronto works.

Ottawa, Ont.—Last week two Grey County contracts were awarded. A wharf at Vail's Point will be built by Grier & Creighton, of Owen Sound, and will cost $6,983. The revetment wall at Meaford will be extended at a cost of $30,000. Greene and Woolerich, of Owen Sound, are the contractors.

Ottawa, Ont.—The Cabinet have awarded the following contracts: Canadian Dredging Co.—No. 5 section of the new Welland Canal, $1,945,788; Maritime Dredging and Construction Co.—Wharf extension and dredging at Chocolate Cove, $26,879; C. Webb & Son—Addition and alterations to Orillia public buildings, $31,485; Maritime Dredging and Construction Co.—Breakwater at Little Dipper Harbor, N.B., $10,593.

Municipal

Dawson, Yukon.—The city is contemplating the purchase of water, light and telephone plants.

Yarmouth, N.S.—The town will spend about $3,340 on a pumping plant. S. C. Hood is the mayor.

Edmonton, Alta.—The city will probably be in the market shortly for a supply of water meters.

Beausejour, Man. — The ratepayers have passed a by-law to grant $3,000 for an electric light system.

Chatham, Ont.—The city will bonus The Summers Bros. Match Co., Saginaw, Mich. Voting, December 15.

Maisonneuve, Que.—The city will reorganize its fire department, and will buy the best apparatus available.

Mimico, Ont.—A by-law to raise $75,000 for a waterworks and sewerage system is being drafted by Clerk Jackson.

Dauphin, Man.—The ratepayers have passed a by-law to grant $20,000 for the extension of the electric light and power plant.

Hamilton, Ont.—The ratepayers will vote in January on the building of an incline railway at the head of Sherman Avenue.

Kingston, Ont.—The Utilities Committee will consult with a Hydro-Electric engineer re a new pump for the waterworks.

Montreal, Que.—The. Council. have passed a by-law to grant $2,000,000 for the purpose of establishing a municipal electric plant.

Medicine Hat, Alta.—The ratepayers have voted $1,500,000 for next year's work, and have granted concessions to a drinking fountain factory to locate here.

Ottawa, Ont.—The first contract in connection with the Gatineau water project will be let in about six weeks. The first construction contract will be let about April 1.

Montreal, Que.—A garbage reduction plant has been recommended by R. S. Lea, consulting engineer. He would build it outside the city, and haul the garbage by rail.

Toronto, Ont.—It is proposed to widen Yonge Street, in North Toronto, to 86 ft. G. W. Mountain, chief engineer of the Dominion Board of Railway Commissioners, made an inspection of the ground last week.

Toronto, Ont.—That a by-law providing for erection of a $200,000 municipal hospital in Riverdale be submitted to the ratepayers on January 1st is the effect of a motion which Ald. Rowland will introduce at the next session of the City Council.

Oak Bay, B.C.—The ratepayers have voted $150,000 for sewer purposes; $35,000 for a water supply. The engineer has been instructed to purchase pumps for sewage, and to call tenders for water mains.

St. Thomas, Ont.—J. T. Lynn, the natural gas expert of Detroit, was in St. Thomas last week, making a study of the city gas plant and the system of mains, preparatory to preparing for the Council an expert estimate of the cost of bringing the system up to date.

London, Ont.—The city has agreed to take gas from the Southern Ontario Natural Gas Co. and the City Gas Co. at 50 cents per 1,000 ft. for first six months and 45 cents thereafter. The contract is for five years. J. C. McDowell, Pittsburgh, Pa., is president. Both the company and the city will require piping.

Edmonton, Alta. — Ratepayers will vote December 8 upon two proposals, both designed to supply natural gas to consumers at low rate, as follows: The Pelican Oil and Gas Co. at 15 cents a thousand feet, delivery November 1, 1913, or to expend about $300,000 for exploration work under municipal direction in the Vegreville and other fields.

Curtis Air Compressors

Have About 80% More Water Cooled Area Than Double Acting Types

This is only one of the many features of Curtis Compressor design that make for maximum output. It's a feature you should consider when selecting a compressor, because it insures lower discharge temperature, less loss of power through shrinkage of air in receiver and pipe line, and it also insures a larger amount of air compressed each stroke.

There are other features equally as important that are strictly Curtis features only, for instance, light vanadium steel disc valves (only 1-16 of an inch in thickness, and never require "grinding in"); valve design that makes for minimum clearances. And other features which lack of space prevents our mentioning.

Tell us your air requirements, and we will gladly send you full information and prices.

Tenders

Toronto, Ont.—R. Stanley Dollar, of San Francisco, has tendered for the supply of 35,000,000 feet of timber for the new harbor works of Toronto for delivery in 1915.

Victoria, B.C.—The city engineer is advertising for bids for 10¼ miles of 36-inch steel riveted pipe, and a telephone line for the Sooke waterworks system. The last tenders were rejected.

Stamford, Ont.—George Laing, of Port Colborne was awarded the contract for sinking Artesian wells for Stamford waterworks system. The clerk will call tenders for pumping equipment and water mains.

Brockville, Ont.—Tenders will be received by the undersigned for the supplying of two 300 h.p. water tube boilers and for an electric-driven turbine pump. The Brockville Water and Light Department. E. J. Philip, manager.

Ottawa, Ont.—Tenders addressed to the undersigned will be received up to January 8, for the construction of a Steel Twin Screw Icebreaking Steamer of the following leading dimensions: Length B.P., 275 feet; Breadth extreme, 57 feet 6 inches; Draft mean, 19 feet; Indicated horse power 8,000, to be delivered at the King's Wharf in the city of Quebec. Alex. Johnston, Deputy Minister of Marine and Fisheries.

Winnipeg, Man.—Tenders will be received up to December 4th, for one steam locomotive, with separate tender and snow plow. The locomotive shall be in good condition, in good working order, and capable of hauling fairly heavy loads up two and one-half per cent. grades and negotiating twelve degree curves. The weight, when in working order, must not exceed forty-five tons. The tender to have a capacity for three thousand gallons of water and seven tons of coal. Prices to be F.O.B. Lac du Bonnet Station, C.P.R., Manitoba, including freight and Canadian Customs, etc. M. Peterson, secretary.

A. J. Balfour, managing director of the Eagle and Globe Steel Co., Sheffield, Eng., passed through Toronto last week on his return from a trip to the West.

M. J. Butler, formerly manager of the Dominion Steel and Iron Co., and now manager of Armstrong & Co., Montreal, has agreed to act as expert to decide whether St. John, N.B., has been discriminated against by the C.P.R. Steamship Co. and the Intercolonial Railway.

Railways—Bridges

Montreal, Que.—The Montreal Tramways Co. has asked the city for an extension to its franchise if it will undertake underground railways.

Brantford, Ont.—If the city secures control of the street railway, the Hydro-Electric and Railway Departments would be run by one commission.

St. Catharines, Ont.—The city engineer has prepared two alternative plans for a bridge across the old canal connecting the city with the western hill.

Montreal, Que.—The Canadian Autobus Co. has intimated to the city that they are prepared to construct tubes to serve the downtown and up-town districts.

Hamilton, Ont.—The Ontario Municipal and Railway Board has ordered the Hamilton Street Railway to equip its heavier cars with air brakes inside of six months.

Vancouver, B.C.—The Esquimault and Nanaimo Railway have recently purchased a large air compressor to serve the pneumatic tools in the roundhouse and for other purposes.

Fire Insurance Never Prevents A Disastrous Fire

But Manufacturers' Automatic Sprinklers Do

In case of fire, insurance minimizes your actual monetary loss. Insurance, however, can never recompense you for the interruption to your business, for loss of prestige, for business lost to your competitor, nor for profits you lose while your plant is disabled.

Manufacturers' Automatic Sprinklers will give you complete and absolutely effective insurance.

Write for estimates on equipping your old plant or your new one.

E. Horton & Son Company, Windsor Locks, Conn.

The Northern Ontario Engineering Works, Ltd., Cobalt, Ont., have made an assignment. A meeting of creditors will be held in the office of W. F. MacPhie, assignee, Cobalt, on December 1.

The Spring and Axle Works Co., Guelph, held its fourth annual banquet on Thursday last, at which fifty guests were present. Messrs. Alexander, Brett and Younger made speeches.

The R. Laidlaw Lumber Co. has shipped three cars of 3-inch white pine to England to be used by pattern-makers in the Government navy yards. At the same time a similar quantity was sent to the States for a like purpose.

Wabana, Ore.—Ore shipments from Wabana to the steel works at Sydney, N.S., this season will exceed by 50,000 tons those of last year. The shipments for 1912 were 750,000 tons, and it is expected that those for this season will be over 800,000 tons.

E. Leonard & Sons, Ltd., London, Ont., makers of engines and boilers, have supplied an engine at each of the following points on the National Transcontinental Railway: Edmundston, N.B., Napadogen, N.B., Moncton, N.B., Parent, Que., St. Foye, Que., Grant, Que. The first mentioned three engines are erected and ready to commence operations. They are now erecting the one at Parent and the one at St. Foye has just been shipped. The Commission are not yet ready to receive the engine at Grant.

Robert Patterson, master mechanic, and Superintendent Forester conducted a party of prominent officials over the G.T.R. shops and new station at Stratford, Ont., on Saturday, November 15. The party included: Vice-President H. G. Kelley; Superintendent Whittenberger, of the Middle Division of the G.T.R.; J. Markey, master mechanic of Ontario lines; H. Ferguson, superintendent of tracks on Ontario lines; G. A. Mitchell, superintendent of bridges and buildings, and W. D. Robb, superintendent of motive power.

Columbian Facing Mills Co.—In no single line or branch of the foundry craft trade has there been greater progress made than in that of manufacturing foundry facings. The Columbian Facing Mills Co., successor to the Buffalo Foundry Supply Co., Buffalo, N.Y., inform us that their Columbian Dry Sand and Loam Facing was employed in the production of a one-piece casting, weighing 232,000 pounds, and as the latter is believed to have established a world record, considerable pride is felt and credit taken for the successful outcome of the job by the individual members of the Company, Harry and Marc Heinsheimer.

ENGINEERS

THIS book deals largely with the foundation principles which govern the practice of steam engineering. Nothing so soon condemns the applicant as want of knowledge of the every day practice and simple laws relating to the care and management of a steam plant.

No one is expected to know everything, but all are required to be familiar with certain facts which may be called "the beginning of things."

The lack of knowledge of the small things carries conviction of the same lack in the larger.

Plain facts, that you should know, are plainly explained in AUDELS ANSWERS ON PRACTICAL ENGINEERING, ans-[illegible]

Air, Water, Steam, Fuel and Heat, Steam Boilers, Boiler Construction, Water Tube Boilers. The Steam Gauge, The Safety Valve, Properties of Steam, Installation of Boilers, Management of Boilers, Engineers' Law, Firemen's Law, Steam Engines, The Valve and Valve Gear, The Corliss Engine, Engine Arithmetic, Lubricators, Installation and Operation of Engines, Steam Pumps, Injectors, Feed Water Heaters, Steam Heating, Steam Traps, Belts, Gears and Pulleys, Steam Turbines, Refrigation, Practical Electricity, Elevators.

Understand the framework of which your work is but a cross bar. Know something of the cause of which your work is but an effect. Know something of the effect of which your work is the cause. And, above all, know why it is done one way and not another.

LEARN THE THEORY UNDERLYING THE WORK

PRACTICAL ENGINEERING contains 288 pages fully illustrated, handsomely bound and printed, and is in every way a first-class book.

FREE (No Duty)
EXAMINATION

Sign and mail the coupon, and it will bring to your plant a book of sterling merit, for free examination. You can have one week in which to dig out valuable information contained in its 200 or more pages.

THEO. AUDEL & CO., 72 5th Ave., NEW YORK

Plea send me for examination one cop **Audels' Answers on Practical Engineering** **$1**

If I keep the book I promise to send you within 7 days after receiving it ONE DOLLAR in full payment; if I do not keep it, I will mail it back to you within 7 days.

Makers of Modern Germany

Germany is the most progressive, aggressive and successful of the commercial nations in the world today. Her rapid rise is due to her ruler, the Kaiser, and a few men around him.

MACLEAN'S MAGAZINE is running a series of fascinating stories of these men written by one of Europe's most famous journalists—Frederic W. Wile, Berlin correspondent of the London Daily Mail. These stories of the masters of German business, politics and philosophy, will appeal strongly to the business man and his family.

Ballin, Hamburg merchant, the first of the series appeared in the November Number. It is a record of wonderful achievement, showing how an unassuming Jewish lad rose to the top of the Hamburg-American Steamship Line.

Bebel—The Red Napoleon

is the second of the series and appears in the December Number of MacLean's.

This graphic sketch shows how a man rose from the rank and file to be a leader of the Opposition. The idol of his followers, and the most popular all round politician the Fatherland has ever known.

He was a born tactician, cool and calculating to a degree. The right thing occurred to him intuitively, whether leading stormy party sessions or fencing with the government and rival politicians in the Reichstag.

Bebel would have made a great business man, a great field-marshal or general staff chief. He imbibed organization and discipline from the cradle.

Read this story and the other good things that are found in the December Number of MacLean's and you'll become a proud subscriber to Canada's great national magazine. The January number will tell the story of the man who built the German Navy. Don't miss it.

Annual subscription two dollars.—Commence now to ensure getting the whole German series, which will run for over a year.

TENTH ANNUAL GREETING

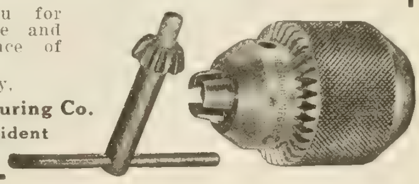
To Our Customers:

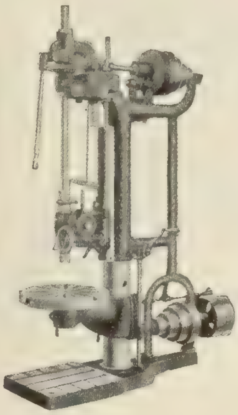
This being our tenth birthday, we desire to express our thanks and appreciation for your valued patronage, which, with that of others, has made the past year the most prosperous year during our phenomenally successful career.

The fact that even though the past year has been disastrous with some, it has been prosperous with us, and that our customers who purchased Chucks from us ten years ago, have since, up to the present time, increasingly purchased them is, we think, most convincing proof of the superiority of our product.

Again thanking you for your liberal patronage and soliciting a continuance of same, we are

Yours very truly,
The Jacobs Manufacturing Co.
A. I. Jacobs, President





Let This

"Mechanic's Drill"

solve your drilling problems for you.

It has gone into the plants of many of our customers and done their drill press work so efficiently that at the first opportunity they've ordered more.

The "Mechanic's" is a straight forward drill press with lots of power to drive high speed drills up to the limit of their endurance. It may be had either with or without Tapping Attachment, and is made in a variety of sizes, both single and multiple spindle.

16 in. Lever POST DRILL

A Giant Little Machine For Light Drilling.

Will drill up to 7/8 inch.

The Feed Lever Socket is adjustable on the feed shaft, to provide for setting the lever in the most convenient position for the operator.

An adjustable friction is provided for the feed shaft, which acts as a balance to the weight of the spindle.

Bevel Gears, Feed Pinion and Rack are all machine cut, working smoothly and without noise.

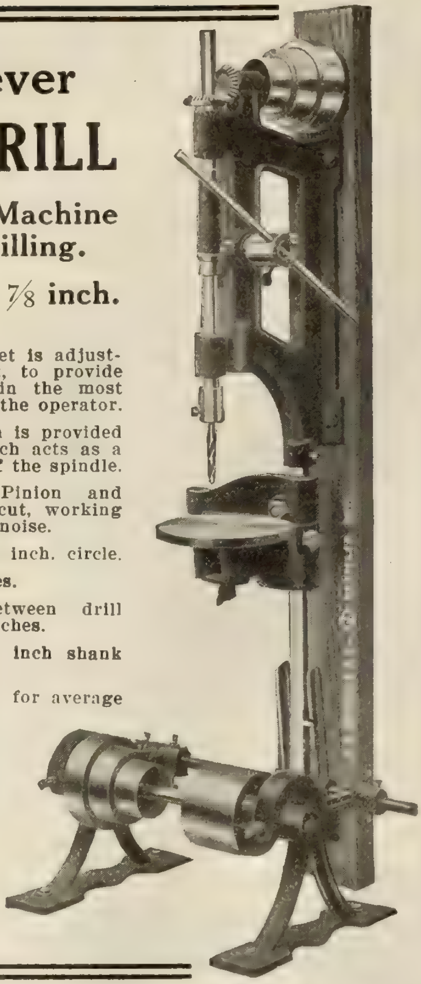
Drills to centre of 16 inch. circle.

Run of feed 5¼ inches.

Greatest distance between drill spindle and table, 23 inches.

Spindle bored for ½ inch shank twist drills.

Speed of countershaft for average work, **300 per minute.**

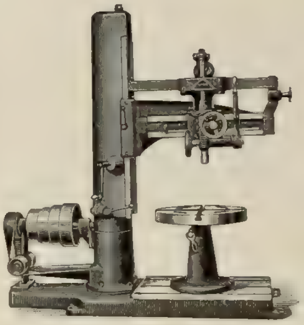


A. B. Jardine & Co.

Hespeler, Ontario

AS THE EYE IS

A Radial Drill that will not act as freely as the eye is not a perfect tool.



The New Gang Radial Drill Catalog ready for mailing.

Let the "Brazo-Hardening" Process Save Half Your Reamer Costs

The benefit accrues to you in this way. Our

"PEERLESS" HIGH-SPEED REAMER

has blades of the finest quality, selected high speed steel, solidly joined by our patented "Brazo-hardening" process to a one piece soft steel body. We can thus provide durable cutting edges and a soft, tough supporting body at about half the cost of other high speed reamers.

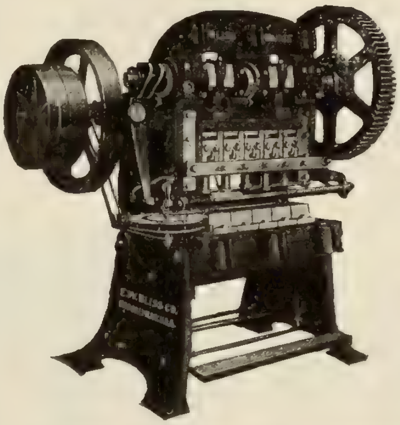
"Peerless" Blades *never come loose* — a new reamer if they show evidence of such a defect. That's a liberal enough guarantee to make you interested in full details.

Ask for Catalog No. 36-C.

The CLEVELAND Twist Drill Co.

New York CLEVELAND, OHIO Chicago

Five Operations Every Stroke



Five times as fast, it means multiplied production, reduced costs, and saving in shop room.

Bliss Automatic Combination Presses

perform five operations every stroke, eliminating intermediate handling and all danger to the operator's hands.

They produce with great economy articles requiring a series of operations, and are adapted for making harness oil can tops, bottle stoppers, lamp sockets and burners, and many electrical stampings.

Details on request.

E. W. BLISS CO., 20 Adams St., Brooklyn, N. Y., U.S.A.

Representatives for Chicago and Vicinity:
STILES-MORSE CO., 565 West Washington Street, Chicago, Ill.

Universal and Tool Grinding Machine

This machine is designed to meet the requirements of the tool room in the grinding of milling cutters, formed cutters, straddle and face mills, beveled cutters of any angle, straight or taper reamers, etc., and in addition cylindrical grinding, either straight or taper, can be done.

BROWN & SHARPE

The problem of permanent accuracy, so essential in Tool Grinding Machines, is solved by the B. and S. design and careful workmanship.

Accuracy demands both ample rigidity and correct alignment. Continued service, extending over long periods of time, is the test to which hundreds of B. & S. machines have been subjected.

If you are interested in the machine shown here ask for Bulletin of the B. & S. number 13 Universal and Tool Grinder Machine.

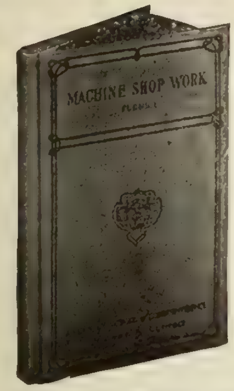
Mechanical Engineering Books

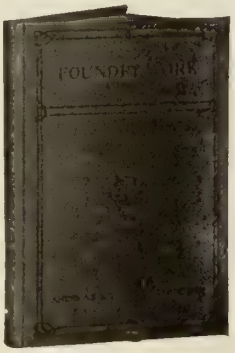
If you are desirous of improving yourself in your trade and so putting yourself in the position of making more money, these Mechanical Engineering Books will be found helpful.



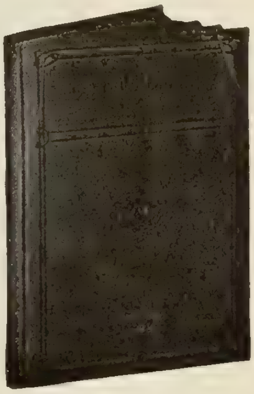
MACHINE-SHOP WORK. By Frederick W. Turner, Instructor in Machine-Shop Work, Mechanics Arts High School, Boston. 208 pp., 241 illus. Cloth binding. The use of various hand tools is explained, followed by a comprehensive discussion of the lathe and lathe tools, with the methods of screw cutting, taper and eccentric turning, etc. The way to figure compound gears for screw cutting; drilling; boring; planers; shapers; slotters; milling machines and cutters; how to cut spirals, gears, cams, etc.; grinding; the operation of automatic machines. Price ...$1.50

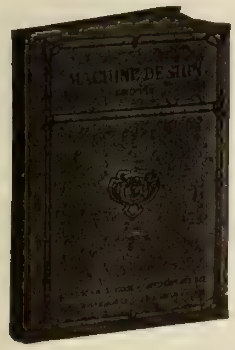
MECHANICAL DRAWING. By Ervin Kenison, S.B., Assistant Professor of Mechanical Drawing, Massachusetts Institute of Technology. 176 pp., 120 illus. Cloth binding. Gives a course of practical instruction in the art of Mechanical Drawing, based on methods that have stood the test of years of experience. Includes orthographic, isometric and oblique projections, shade lines, intersections and developments, lettering, etc., with abundant exercises and plates. Price **$1.00**

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 142 illus. Cloth binding. A practical guide to modern methods of moulding and casting in iron, brass, bronze, steel, and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price **$1.00**



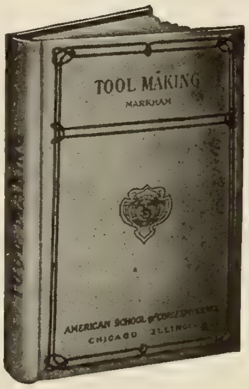
PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price **$1.00**





MACHINE DESIGN. By Charles L. Griffin, S.B., Assistant Engineer, the Solvay-Process Co., American Society of Mechanical Engineers. 208 pp., 82 designs. Cloth binding. Explains in detail how to make the entire design of all kinds of machinery, how to lay out gears, etc., with complete specimen designs of numerous machines. Price **$1.50**

TOOL MAKING. By Edward R. Markham, Consulting Mechanical Engineer, formerly Superintendent of the Waltham Watch Tool Co., American Society of Mechanical Engineers, Author of "The American Steel Worker." 224 pp., 325 illus. Cloth binding. Takes up the methods of treating tool steels—annealing, tempering, spring tempering, hardening, case-hardening, etc.; how to make drills and reamers of all kinds; the making of arbors and mandrels, taps, hobs, reamer and tap-holders, jigs, gauges, dies and die-holders of all kinds, counterbores, facing tools, milling cutters, hollow mills, and forming tools. Gives all necessary information for tool making in all its branches. Price **$1.50**



FORGING. By John Lord Bacon, Eng. and Supt. of Construction, with R. P. Shields & Son, San Diego, Cal., American Society Mechanical Engineers. Author of "Forge Practice." 128 pp., 180 illus. Cloth binding. A working handbook of practical instruction in hammering, working, forming, and tempering of wrought iron, machine steel, and tool steel, including the important modern development of electric welding. Price **$1.00**

Sent postpaid on receipt of price. We can also furnish you with other standard works on Engineering in all its branches, including books for Civil Engineers, Contractors, Electricians, Foundrymen, Steam Engineers, Mechanical Engineers, Municipal Engineers, Railroad Engineers, Sanitary Engineers, Gas Engineers, Hydraulic Engineers, Technical Men.

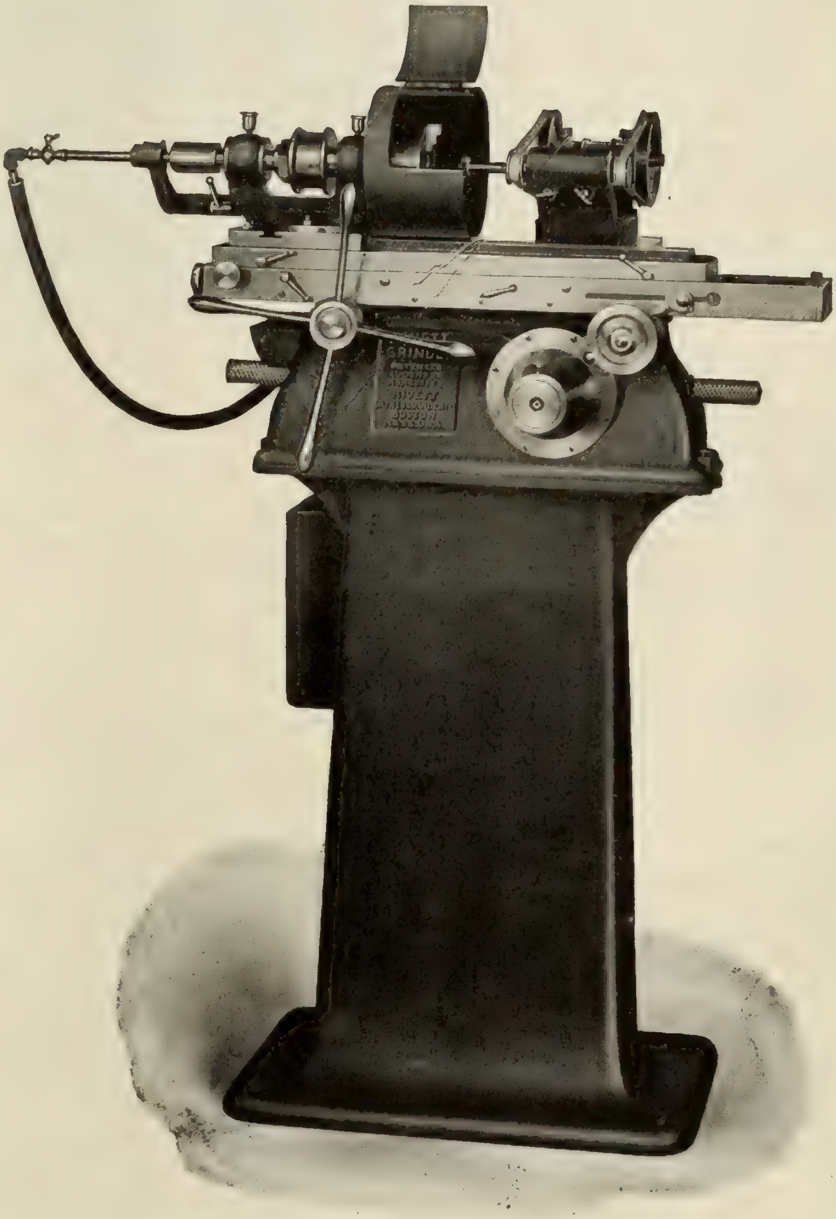
The RIVETT Internal Grinder No. 3 with Water Attachment



Grinding Capacity:

2″ Diameter, 2″ Depth, on straight or tapered holes.

Attachments for External Grinding may be furnished with this Machine.

Important Points:

Automatic Reciprocating Movement.

Automatic Cross Feed.

Graduated Swivel Table for grinding to angles.

Fast Speed Grinding Spindles to suit all kinds of work.

Split Chucks up to ⅝″ Capacity.

If you are interested let us tell you more about this Machine.

The Whiting Converter

is adapted for making all kinds of steel, including such special alloys as Vanadium, Chrome Vanadium, Titanium, etc., from the smallest and most intricate pieces to those weighing several tons.

Simple to operate. Easy to install. A profitable investment wherever steel castings are used in any quantity.

Send for 16-page illustrated catalog just off the press.

Complete Foundry Equipment

We design, equip and install complete plants for Grey Iron, Brass, Car Wheel, Pipe, Steel (O.H. & Converter), and Malleable Castings. Over thirty years' experience. Send for complete set of catalogs in binder.

Cranes of all types for every service.

Don't Be a Commercial Explorer

¶ You haven't time to go exploring round on your own account discovering who's who in machinery and supplies.

¶ Time is too valuable these days.

¶ If you want to buy a machine or piece of equipment the easiest way is to consult this Directory.

¶ *The firms represented here are modern, reliable,* and their prices are right, and *they are already on the map.*

Use this modern guide to good buying.

CANADIAN FOUNDRYMAN BUYERS' DIRECTORY

TO OUR READERS — Use this Directory when seeking to buy any foundry or pattern-shop equipment. You will often get information that will save you money.

TO OUR ADVERTISERS — Send in your name for insertion under the headings of the lines you make or sell.

TO NON-ADVERTISERS — A nominal rate of $1 per line a year is charged non-advertisers.

Nova Scotia Steel and Coal Company, Ltd.

BEG TO ANNOUNCE

That their new Steam-hydraulic Forge Shop is now in operation, as also is their recently installed "Harmet" Fluid Compression Plant.

These improvements bring "Scotia's" Equipment abreast of the best foreign forges.

They are accordingly open to supply forgings of all shapes and sizes, made of Best Ordinary or Fluid Compressed Open-hearth Steel, and satisfying the most severe specifications.

For prices and particulars apply to

Western Sales Office, Room 14, Windsor Hotel, Montreal, Que., or
Head Office, New Glasgow, Nova Scotia

An Inside Story Of The Crucible

In the walls of a Dixon Crucible is spun the secret of its efficiency, durability, economy, dependability and its world wide reputation.

If walls had voices, as they are said to have ears, a story of surpassing interest could be told.

—of a concern, the largest, oldest and only one of its kind in the world founded by the inventor of the graphite crucible.

—of a concern with world-wide knowledge of graphite deposits, with use for all forms and grades of graphite and therefore with no incentive to use other than the correct form and grade of graphite in each of its many products.

—of skill in workmanship which only the heritage of 86 years of experiences and discoveries can make possible.

—of a standard which does not permit of anything but absolute uniformity of the highest possible order.

In satisfaction alone it is worth while buying Dixon Crucibles, and in the economy of service Dixon Crucibles are supreme.

Write for booklet No. 223A. "The Care and Use of Crucibles."

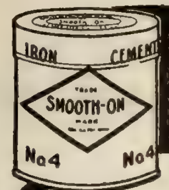
DIXON TRADE MARK



SMOOTH-ON

TRADE MARK REG. U. S. PAT. OFF.

SMOOTH-ON
IRON CEMENTS
No. 1, No. 2 and No. 3

Permanently stop all leaks of steam, water, fire or oil, in iron or steel castings, boilers, tanks, piping, pumps, screw thread joints, flanged joints, etc.

Smooth-On No. 4 is unequalled for filling in blowholes in iron or steel castings.

The Smooth-On Cements are easy to apply and make permanent repairs, proved by years in use.

Every engineer should read our new No. 12 illustrated instruction book—FREE. It tells when, where and how to use the different Smooth-On Cements. Send for it now.

Books for Foundrymen

Three good Books that should interest Foundrymen who wish to know more about their work.

PATTERN MAKING. By James Ritchey, Instructor in Wood Working, Armour Institute of Technology. 160 pp., 250 illus. Cloth binding. Shows the reader how to take the blueprint and from it make the pattern for any kind of casting under any condition. The allowances for shrinkage, draft, and finish are explained. Simple and built-up patterns of all kinds are clearly treated. Various special cases are taken up, such as pulleys, cranks, pipe connections, valves, etc. Price **$1.00**

FOUNDRY WORK. By Wm. C. Stimpson, Head Instructor in Foundry Work and Forging, Department of Science and Technology, Pratt Institute. 160 pp., 150 illus. Cloth binding. A practical guide to modern methods of molding and casting in iron, brass, bronze, steel and other metals, from simple and complex patterns, including many valuable hints on shop management and equipment, useful tables, etc. Price, ... **$1.00**

PATTERN MAKING. By G. H. Willard. To which are added chapters on Coremaking and Molding. 214 pp., 312 illustrations. Cloth binding Dealing with the practical experience of foundry work, tools required; woods adapted for the work; turning; and all kinds of patterns. Price, postpaid .. **$1.00**

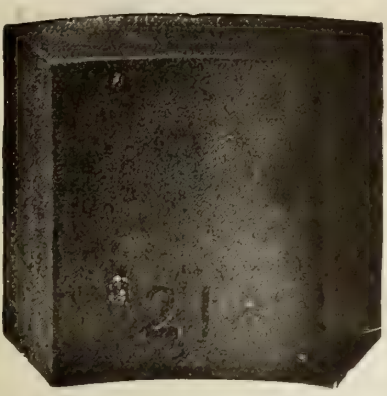
CANADIAN MALLEABLE IRON CO. LTD.
OWEN SOUND, ONT.

ALL CASTINGS GUARANTEED TO YOUR APPROVAL



Forty-Five Chances to Thirteen

Surely, conservative foundrymen can see which way is the profit.

In a Cupola thirty-six inches in diameter, when lined with Fire Brick there are forty-five joints where Fire Clay can fall out and fire can get in which means frequent repair bills to pay.

When **Stevens' Cupola Blocks** are used for the same lining, there are only thirteen joints—the least number possible.

The smoother the inside surface, the less abrasion wear; the fewer the joints, the smoother the surface.

Everything in favor of the block and of this block for it is made of the toughest materials obtainable. They can't be beat for standing heat.

Mixed carloads shipped of blocks, fire brick and fire clay, if desired.

A sign of good profits

FOR YOU--FOR EVERY FOUNDRYMAN

Shelton Metallic Filler

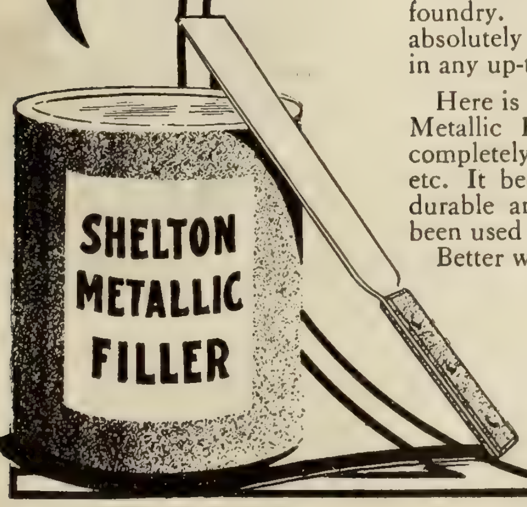
is a guarantee for *bigger results* in any foundry ---it eliminates *make-overs.*

Make-overs are the profit consumers of the foundry. They are a form of waste that is absolutely useless, and should not be permitted in any up-to-date shop.

Here is a chance to stop your losses. Shelton Metallic Filler is guaranteed to fill in and completely obliterate blow holes, sand holes, etc. It becomes part of the casting itself, is durable and can never be detected. It has been used with great success for many years. Better write to us at once.

Every casting means a profit if you are a user of SHELTON METALLIC FILLER
At a slight cost the "bum" casting can be made as good as the *best---don't throw it on the scrap heap.*

SHELTON METALLIC FILLER CO.
DERBY, CONN.



High-Speed Steam-Hydraulic Forging Presses

Double your production with one-half your labor cost and steam consumption Cost of repairs reduced. Eliminates heavy shocks and vibration.

"SINGLE LEVER CONTROL"

Small sizes—single-frame type. Large sizes—four-column type.
Built for doing all classes of forging, shearing or pressing

100 Tons to 12,000 Tons Capacity

UNITED ENGINEERING & FOUNDRY CO.

2305 Farmers Bank Building, PITTSBURG, PA

EXCLUSIVE MANUFACTURERS FOR UNITED STATES, CANADA AND MEXICO
Manufactured under Davy Bros., Ltd., Patents.

STEEL CASTINGS

Of the Highest Prevalent Quality

We make perfect castings at a price that is right.
NEW PROCESS CONVERTER STEEL CASTINGS, annealed and unannealed.

We also make CHROME-MANGANESE AND NICKEL STEEL CASTINGS.
Any size from quarter lb. to 30,000 lbs., absolutely guaranteed.

The Lathe of Maximum Production

WE have put into this new Gap Lathe every feature that makes for economical production — speed in changing, accuracy of cut, quality of cut, and solidity of bed.

All parts taking strain are of ample excess size, and all bearings are large. The gap is solidly supported, and is of extra width and depth.

Correspond with us for full particulars. You can instal one or a battery of these machines in any size of gap within wide limits, and in any length of bed, Write us.

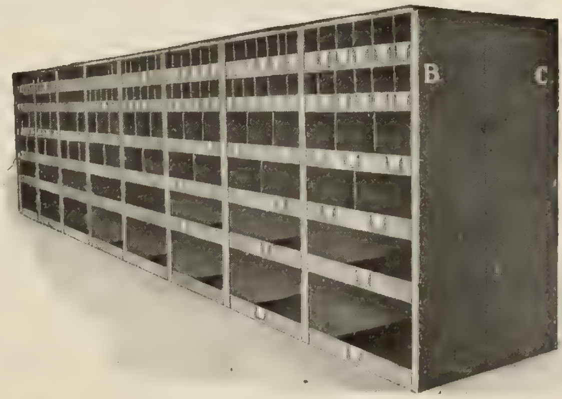
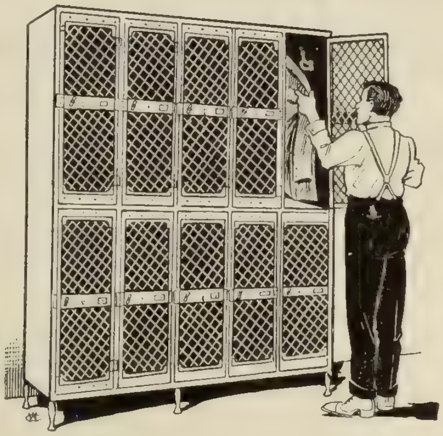
"Dennisteel"



Wardrobe Lockers
Material Lockers
Shelving and Bins
Material Cabinets
and Factory Stools

all effect big savings everywhere



Our **Steel Shelving** economizes space, propromotes system and reduces insurance rates.

It is built on the unit system — sections can be added as requirements expand. It is easily assembled, is adjustable and adapted to many uses. All shelves are provided with label holders.

By installing **Wardrobe Lockers** you will prevent petty thefts, protect your workmen from contagion and create a general good feeling that will result in larger and better production.

Our **Material Cabinets** are adapted for storing a great variety of materials. They are fireproof and compact. Made in any size with any number or arrangement of shelves and compartments desired.

We will be pleased to send full particulars.

Milled Threads

As a manufacturing proposition milled threads cannot be equaled for low cost of production. For the best results this combination is absolutely necessary.

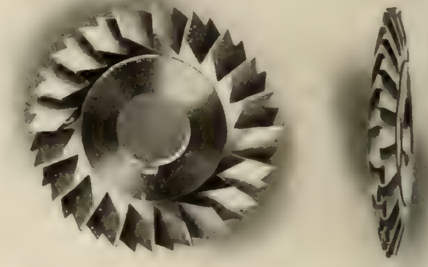
1. P. & W. Thread Milling Machines

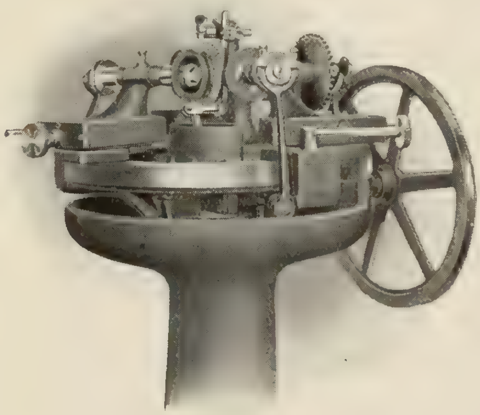
which produce a smooth, accurate thread at one cut in a fraction of the time required by other methods. These machines have proven the most efficient method of cutting threads on precision screws, worms, spiral gears, hobs, taps and are also used for splining and oil grooving shafts.

2. P. & W. Patented Cutters

for P. & W. Thread Milling Machines.

We have made a special study of the problem of cutters for these machines. As the result of years of experimenting we have developed a very superior type of cutter. We manufacture them in large quantities and carry in stock for immediate delivery cutters for all standard threads in various sizes. We are also prepared to furnish special cutters promptly.





3. P. & W. Automatic Grinder

for P. & W. Thread Milling Machine Cutters.

To obtain the best results, use this special grinder which is designed for rapidly and accurately grinding these cutters. This machine is provided with three wheel heads and will automatically grind both the sides and top of cutter simultaneously.

Write for book "Thread Milling Machines" illustrating and describing the several sizes of machines, the cutters, cutter grinder and showing various samples of work done on these machines.

Use the Oil Engine for Power

Where an adequate supply of oil is available, the Fairbanks-Morse Oil Engine has many striking advantages over any other type of engine for power. Some of these advantages are portability, cleanliness; automatic operation, requiring no licensed engineer or skilled attendant; low fuel cost; no expense when not running; absolute safety, no danger from fire, and thorough reliability.

FAIRBANKS-MORSE OIL ENGINES

Will operate successfully on 72 per cent. of the oils distilled from the average crude.

These engines are built in all the common sizes from 2 horse-power up.

The usual excellence of design, careful workmanship and superior materials enter into the construction of Fairbanks-Morse Oil Engines, guaranteeing their service.

Many plants in Canada are now operating our Oil Engines. You will find it to your interest to get in touch with us. Ask for Catalogue 52.

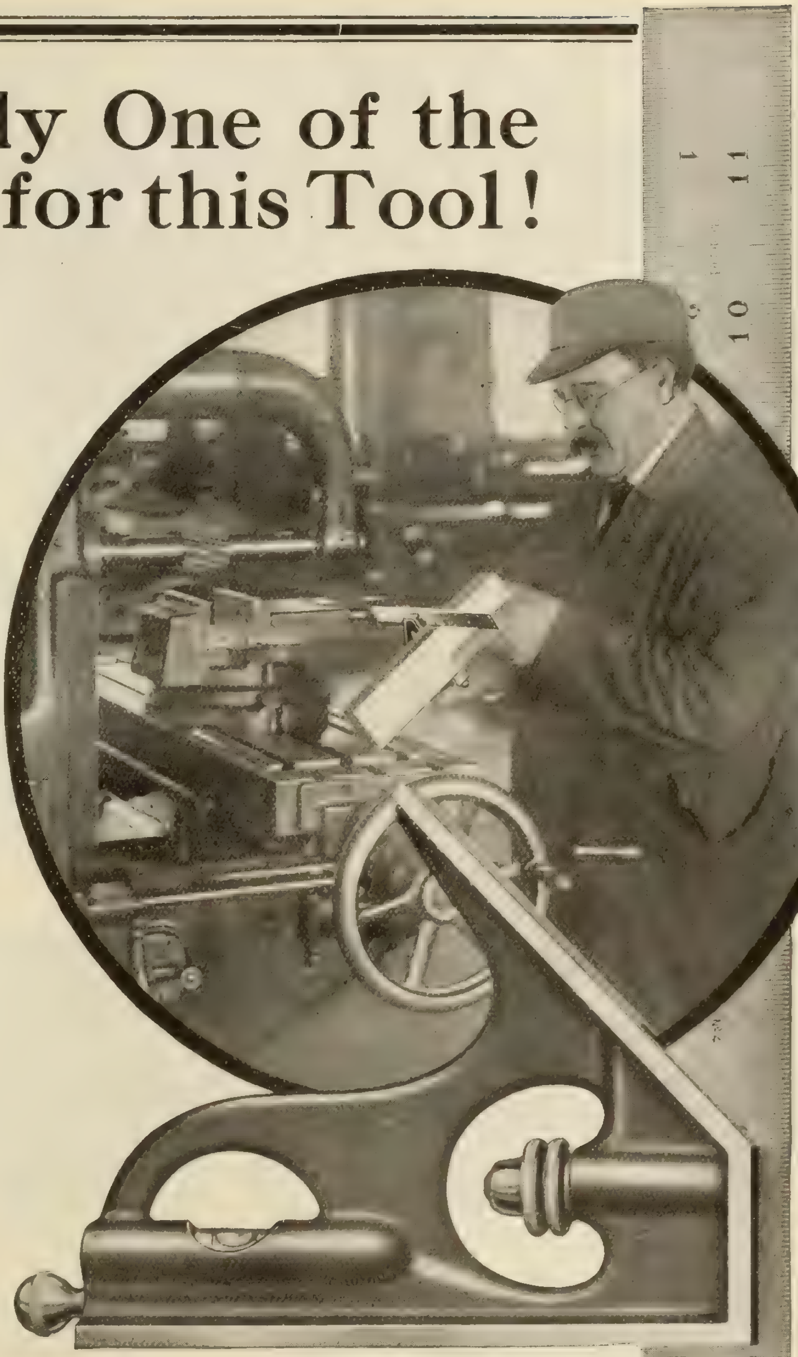
This Is Only One of the Seven Uses for this Tool!



Used as a square it has all the characteristics of the ordinary square but with the advantage of having a blade that will slide to any desired position. The level in the body of the head makes possible other uses not obtainable with the ordinary square. This tool is the

Starrett

Combination Set

It combines in this one instrument the tools used most frequently by a machinist—the rule, square, bevel, protractor, level, centre head, and depth guage. The centre head and protractor may be slipped on or off in the scale in a second, permitting combinations which accomplish much more than any of the individual tools could.

Now this is only an example of what *one* of the Starrett tools will accomplish. We have other tools which for their particular service are just as efficient. The line includes such tools as

Rules
Dividers
Drill Blocks
Scribers
Squares
Center Testers
Gages
Speed Indicators
Calipers
Clamps
Micrometers
Test Indicators

WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 17—
Dividing Centers

Dividing centers enter into milling machine practice wherever work must be milled in such a way as to require the dividing of a circle into two or more equal segments.

The accomplishing of accurate results in dividing the circle is one of the most difficult and delicate operations that the mechanic is called upon to perform. The net result would be astounding were someone to figure out the amount of time and material which have been wasted due to inaccuracy in this respect.

Dividing centers eliminate the element of human "guess work" and apply, in proportion to the correctness of design, the certainty of mechanical construction.

In constructing dividing heads of all types for Milwaukee Millers, we use a worm wheel of nearly double the usual size. We do this because it is no more difficult to make an accurate worm wheel of considerable size than it is to make one of small size. And, the degree of accuracy in each case being the same, the use of the large worm wheel obtains a greater degree of accuracy in the work.

As opposed to our design, many manufacturers place the worm on a different shaft from the one used for the index crank and plate, connecting the two by means of gearing. This has the disadvantage of introducing the error that may exist in the gears. We believe in connecting as directly as possible to the worm shaft, and in this belief we are borne out by best mechanical experience.

Lack of space prevents our giving many important and interesting details about our plain, universal, and spiral universal dividing centers. This information will be given to those who write for our Bulletins which give the "WHYS" in favor of Milwaukee Millers.

"We Are All Passing the Same Way"

¶ The source of most of our everyday sorrows and regrets is that we are in the average, much like the pollywog, the wiggle-tail or the tad-pole, who consider the stagnant pond in which they live, the **sum and total** of the entire universe. Each of us is inclined to be like Rostrand's Rooster—that believed its crowing responsible for the **rising** of the **sun.**

¶ Most of our bickerings and quibblings come from our inclination to pass judgment without knowing the facts; when the verities and realities are not at our disposal. If each of us will take the trouble to ascertain the truth before criticising we will have arrived at a state of development where we are too cool, too calm, too sincere to criticise at all. All criticism is hasty, unthinking and is the first evidence of lack of experience, lack of sympathy, lack of mental physical poise.

¶ It is a good thing for each of us to learn as early in the game as possible, that we are not the centre of gravity; **that the earth does not revolve around any one of us.** When we learn that the annual revolutions of the sun and the diurnal revolutions of the earth were not planned especially to suit our selfish whims, then we ourselves have begun to evolve.

¶ The man who can only see the failings and weaknesses of other men is still a child; a child with a man's physique, but with a high-school boy's conceitedness—a child dressed in man's clothes. The man who sits in his room, or in his office, or who loiters on the street corner, or stands at some wheel of trade or at some occupation in business, hating, criticising, condemning his fellow men, still has the snarl of the hyena lingering in his heart and blood, and represents more animal than intellect; more hate than soul; more jealousy than heart.

¶ The man who lives by the prescribed and accepted standards and formulas of life, is not necessarily **a man.** A man in the real sense of the word, is that male individual who keeps his battle of right and wrong with his moral, mental and physical self—who performs what his better and finer instincts and desires prompt him to perform; a man who does the things he is not compelled and obligated to do, except **by** the **judgment** of his **better self.**

¶ Down the Path of Life all of us are passing the same way, and the man who will say or do that which he knows must injure another, is still in the same mental state as the cliff-dweller; or the savage who fought with the catamount for a place to sleep when night approached. No man, who is such in the real sense of the word, will carry gossip or meddle in the business of others, or condemn or despise because someone else does not see, or think, or work as he does. Never a man criticized another without knowing that he was violating his obligations to his higher and better promptings.

¶ Someone is responsible for the statement that '**he who has never known folly can lay no claim to wisdom.**' And if we say ill of a man, knowing that it can do him financial harm; when it may place a difficulty in the way of his advancement, to that extent do we cease to be **a man.** If we fill our minds with jealousy because of another man's success, we are still very low in the scale of intellect, and there is something wrong with our body and with our soul.

¶ In closing these reflections I would suggest that for boys and for girls, men and women, professional men and business men—for people individually and collectively,—an ounce of **confidence** is worth a thousand tons of advice and criticism.

Efficiency

These articles are copyrighted, and must not be reproduced in part or whole without the permission of The MacLean Publishing Company.

INDUSTRIAL NOTABILITIES--No. 11

WHEN business men go to Hamilton and ask street car conductors for the Steel Company, they usually are sent to the plant of the Steel Co. of Canada, when they are really searching for the Canada Steel Co.'s plant; and vice versa. It doesn't matter much, for they are quite near to one another, but they differ in this respect, that one is an amalgamation of several steel concerns, whereas the other was organized only two years ago by William Mark Currie when he was twenty-nine years of age. To-day, at thirty-one, he is vice-president and general manager, and this is how he got there:

"I've always taken care of myself," he says, "and have never been discouraged. When I encountered difficulties, I stayed right with them, and had confidence in my ability to succeed. It has been a perpetual scrap to get ahead of the other fellow. I found it necessary to spend four or five years in the mills, roughing it, to gain practical experience. I believe, to succeed, a man must have imagination and practical business ability to put it on a working basis."

It is interesting to note the steps taken by this young steel-maker to achieve success. To begin with, he was born at Port Perry, Ont., in 1882. After receiving an elementary education, he took a course in electrical and mechanical engineering at Toronto University, graduating in 1903. For a time he worked in the plant of the Westinghouse Co. at East Pittsburgh, and in 1904 went over to the Carnegie Steel Co. at Homestead, Pa., working twelve hours a day. The following year he returned to Canada, taking charge of the testing department of the International Harvester Co., Hamilton, handling all the material used.

WILLIAM MARK CURRIE.

In 1906 the Steel Company of Canada engaged Mr. Currie as chief inspecting engineer, and he held that job down until 1911, when he left to organize the Canada Steel Co., for the manufacture of steel bars, consisting of flats, rounds, squares, angles, etc. In this company he is one of the largest shareholders. Their output is 250,000 tons a year, and they employ 300 hands.

His imagination and ability to stay with difficulties were clearly demonstrated this summer, when the plant was almost completely demolished by fire. In a very short time, however, it was put in temporary working shape, and has since been rebuilt and equipped with new machinery, without closing down.

Mr. Currie is an enthusiastic golfer and a member of the Hamilton Club. He is married, has a boy and girl, and lives at Hamilton.

Engineering Workshop Organization and Development*

By Hans Renold

After referring to the work of Mr. Fred Taylor, to whom he gives the credit for originating a systematic method of business organization, the author enumerates the necessary spade operations before systematic management becomes possible. He submitted to the meeting an interesting series of charts showing the organization of the Renold chain-making works at Manchester where no help from a professional adviser was called in, and incidentally stated that the system adopted had been developed by men grown up and engaged in the business during its existence of thirty-four years.

THERE is probably no large business establishment anywhere to-day but calls in a professional public accountant to audit its commercial books and prepare the yearly balance sheet. This, however, was not always so.

In the United States during the last 15 or 20 years, another kind of public profession has begun to establish itself, is growing, and is made more use of year by year. It is not only used by engineering firms, but by all sorts of businesses, such as railways, publishing houses and every sort of commercial and industrial establishment. The profession I refer to is that of the public business organizer.

The Public Business Organizer.

I believe these business organizers had their beginning some 20 years ago with Fred Taylor, when he was manager of a large iron and machine works in Philadelphia. Through pressure of orders, he had to face the problem of how to get more work out of his shop than had ever been produced without increase of men or machinery. In a sense, Mr. Taylor showed himself intensely practical by being able, though a manager of a large concern with a widely varied product, to observe and analyze the minutest movements of the work performed by his men when tending the various machines, such as small and large lathes, milling, drilling and planing machines, etc., etc.

Mr. Taylor, amongst a great variety of investigations, also observed, studied and classified the movements of the navvy and his output. He compared the work done by a small and a large man when handling a small, large or medium sized spade or pick. He also investigated the movements of the bricksetter laying bricks in his customary way, and found that it was possible to eliminate 16 movements, utterly unnecessary, and, therefore, wasting a considerable part of the man's energy.

Investigations of every-day workshop operations, and tabulating the results, have shown Mr. Taylor that often a two and three times larger and better production could be obtained with a gain to both, and without hurt to either man or master, provided an intelligent administration, with a reasonable and sympathetic handling of men and machines was adopted.

Many readers no doubt have heard both good and bad reports about the so-called Taylor system. I am also acquainted with workshops, which have made attempts to modernise their shop methods, which led to very varied, and in some cases, very disappointing results.

Causes of Failure.

When looking more closely into these cases where unsatisfactory results were obtained, I have invariably found that it was not the idea nor the system that was at fault, but the way they were handled. The underlying principles were not fully understood, and results were expected before the necessary preliminary spade work had been done.

More often than not, when difficulties arose, it was because the common respect, which every man owes to his fellow-worker, was wanting, and, therefore, the necessary tact for a successful management was non-existent. Many masters did not sufficiently realize this, nor did they make it sufficiently clear to their men the new and altered conditions under which the work had now to be done. The workman's natural slowness and hesitancy to adopt new methods, his suspicions, well or ill-founded, were not taken sufficiently into account.

Sometimes when the profit became considerable, owing to a more systematic working, a fair and adequate share was not allotted to their working men. All parties to a successful working should clearly understand what is expected of each, and not the least of the managerial duty is to explain to the workman that his share of remuneration can only be a part of the benefits derived, and that the extra gains are due to a number of contributory causes.

Tactful Leadership Necessary.

Quite a staff of clerks and trained men, with a good technical knowledge, are required to prepare data and charts of the work as hitherto done, and for planning how to be done in future. There is no denying that the working of an efficient system requires men of tact and power to lead, who can command and should receive a salary which will absorb not a small part of the extra gains obtained. In short, the additional production both in quantity and quality is not all gain that goes into the master's pocket, as unfortunately there is some danger that the misguided, not too intelligent working man is led to believe by some of his leaders, who can only live and hold their posts by the ignorance of some of the men they try to mislead.

Personal Experiences.

Relating my personal experience of a fairly large engineering works in America, I may state that some five or six years ago the managers were so impressed by the wisdom and economic results foreshadowed by the Taylor system, that they decided to accept it, and tumbled headlong into it. Naturally, a hasty adoption brought, for a long time, nothing but confusion, disappointment and failure. To extricate this firm from its difficulties and trouble, it took the organizing engineer some three years to bring about some better results. Their difficulties were naturally all the greater because they had so suddenly abandoned their old and tried ways of shop management, and adopted, without the necessary tact and caution, new methods only half understood.

Spade Work Necessary.

Under the headings 1, 2, 3, 4 and 5 I have enumerated some of the necessary spade work requiring study and time before a systematic management becomes possible.

1.—The hundred and one small tools and appliances necessary to carry on the diverse operations of an engineering shop should first be studied as to what is their best form and shape for the work to be done, then to standardize and adopt them. Their sizes should be reduced to a reasonable number, and a stock kept ready in the stores to be given out when required. Duplicating is so much cheaper than making single individual tools.

2.—In far too many instances laborers and workman need more or less training. They need to be shown how to go about their work, and how to serve their machines to obtain the greatest efficiency. The manner in which cutting tools should be ground and used must be explained, or, better still, arrangements made so that all cutting tools are ground by one man only on special grinding machines. Newly ground tools should daily be given out from stores and carried by messenger boys to the machine men, so that there is no need for them ever to leave their machines and waste their own and much more valuable time. A system of electric call bells offers great advantages, and when once installed, will never be given up again.

---

*From a paper read recently before the Manchester (Eng.) Association of Engineers.

3.—The best method of fixing a piece of work, the course to be followed when machining, and what is the most suitable machine for the work to be done are other points. The machines should be kept in such a state of repair that they can really perform the work expected from them. Neglected repairs have a twofold bad effect. They curtail production and lower the quality of work, but what is still more important, they make the workmen dissatisfied, as they cannot steadily pursue their work, nor earn what is their due.

4.—Speed and feed charts ought to be established for the various machines doing work on pieces differing as to size, structure and material. Attention to the grouping of machinery about the works is of great importance. To obtain the most economical results with least waste of time and effort, carting of the work to and fro unnecessarily should be avoided.

5.—Where to locate stores and how supplies and work should be given out are very important points, often requiring not a little study and organization.

Success Follows Attention to Preliminaries.

All these five points are preliminaries, and form, as I have called them, the spade work, before a systematic management can begin, and beneficial results be shown. This spring when I again visited the firm mentioned above, who had adopted the Taylor system too hurriedly, and when only half prepared, I found that they were then in a fair way of making a success of it. The work they now produce is at a greatly reduced cost, in very much larger quantities for the plant they possess, and their work is of greatly improved quality. Everybody—management and workmen—were much happier, full of interest in the work they were doing, and keenly alive to the fact that a great deal more was yet possible; in fact, they all felt to be at the beginning of a new era.

On my recent visit to the States I also spent a little time with a friend of many years' standing. He is the technical head of perhaps the largest machine company making typewriters. They have four factories in different States, a considerable distance apart from each other. The reorganization of all four works had recently been finished by a public professional business organizer, adopting the so-called Taylor system. As a consequence, they are able to-day to show economic results well-nigh incredible. Some cost figures were shown to me, which I would have doubted, had I not so well known the people from whom this information came.

When the professional business organizer first began his work in these four factories, for many months he could do nothing more than spend his time in consultation with the heads of the various departments and collect data about the work as hitherto done, and tabulate the results. Naturally it took months before a full grip was obtained of the ways the factories were run and before improvements could be suggested, some of which demanded quite radical changes in the machines used, the personnel of the staff and the class of workers employed. Some improvements of details, standardizing of tools and appliances, methods of store and stock—ordering, keeping and giving out—could, of course, be introduced in the very early days when he began work. A system of card indexes and special stationery could very easily be adopted in the drawing offices, cost and bookkeeping departments, and their methods and routine of work improved.

Organization Development.

It goes without saying that organizing large works can never be said to be really finished; still a tolerably complete state of organization can be reached in from two to three years, but it must be taken in hand energetically and with spirit. Very often it is well to retain the services of the professional business organizer as a permanent part of the system, and he then makes a visit of one or two days every month. Thus the man who has conceived and worked out the system has an opportunity to see how his work is carried out, and what modifications time and experience may suggest in the different departments. Often from time to time he can make modifications and improvements, which occur to him through working in other manufacturing concerns, although they may be producing widely different articles from what typewriting factories make.

I have had the pleasure of meeting Mr. Fred Taylor three times. The first time was some 15 years ago, when, still manager of the Midvale works, he had developed a process for hardening ordinary carbon tool steel giving results nearly as good as we obtain from high-speed cutting steel, which to-day can be bought from almost every steel maker. Mr. Taylor has long ceased to be manager, and has begun business as professional adviser, to reorganize especially engineering works, or, as the Americans like to call it, to modernize them. His firm, however, is to-day ready to undertake almost any kind of business that needs bringing up-to-date. I have spent a whole afternoon this spring in the largest and most modern publishing and printing house in existence, which Mr. Taylor's firm have not only organized, but helped to design from the very beginning when new quarters had to be built.

So far I have used the name of Fred Taylor only, but it must not be thought that he has a monopoly as professional adviser in America. There are hundreds or men to-day—all more or less his disciples—working on his lines and specializing on all kinds of businesses. As far as I know, Mr. Fred Taylor is the first who advocated and introduced a scientific and systematic workshop management, and greatly owing to his enthusiastic personality, has obtained most astonishing results. His enthusiastic work, logical thinking, and the great results obtained, sometimes lead him, when he sees in his mind "the highly developed workshop of the future," to write in a strain which an ordinary workshop manager cannot understand. In such cases Mr. Taylor is often condemned and called a crank, a fanatic or a visionary.

Coming now more intimately to the subject indicated by the heading of my paper, I must begin by stating that the organization of an engineering works is far too big a subject to do more than just touch upon a few of its main points. How could it be otherwise, when one sees the great difference there is in the work done by a large Lancashire textile machine firm, a shipbuilding yard, a sewing, machine manufactory, steam, gas and oil engine works, a machine tool shop, or a place where cycles, motor cars and wagons are manufactured.

Definition of Scientific Management.

Scientific management is neither more nor less than common sense, tabulated and applied with tact and reason when facing the every-day problems as they arise in engineering works, such as enumerated above.

The organization of an up-to-date works, therefore, must be a living organism, adjusting itself constantly to the varying demands made upon it. It must grow with the size of the business and change with the ever-changing demands made by the public for the articles manufactured. The details of an organization must naturally be very different when the articles have to be produced in large masses, in small quantities, or in single pieces, each different to the other. To a society composed of practical men, it would be of very little interest, and certainly of little use were this paper to contain a mass of generalities, stating that this and that should be done and so and so be avoided.

The system adopted by my firm has been developed during a number of years by men grown up and engaged in the business during an existence of thirty-four years.

Cultivating Apprentices.

One great and helpful element in our organization is the fact that from an early date we have taken great care with young men and have established a carefully graded apprenticeship system offering every facility for learning, and giving liberal remunerations, which are always attractive to ambitious youths. We thus secured a good supply of young men of good character, very often the sons of our own workmen and foremen. We specially looked out for students and graduates from technical schools and universities, and in many cases found amongst these our future leaders and best workers.

I need hardly say that we never thought of adopting the custom, which at one time was far too prevalent, of asking a premium for an apprentice. We early recognized that for making good business men and engineers, energetic young men of poor or middle-class parents, who have made some struggle to get a good secondary or higher grade education, were more desirable than those who could pay a premium.

Organization Features.

The business organization is that of a private company established in 1879. From a very small beginning it steadily grew, until to-day it employs some 1,300 men and women all told, and is carried on in two works—the old one in Manchester and the new one some four and a half miles outside the city among green fields with plenty of light and good air. I need hardly say that carrying on work in two places is not the most economical, nor is it conducive to establishing the best or simplest organization. However, building operations have just begun at the last named plant, with the view of moving the whole of our town works there, and thus have all our manufacturing and commercial departments together.

Product Manufactured.

The goods manufactured are driving chains used for a great many purposes. Sprockets on which these chains run are made in sizes varying from a few ounces to three and four tons. The growing difference in size and character of work done will soon demand a still greater sub-division of departments than is shown in the present charts. To carry on such a business, where new productions with new methods of manufacture are constantly called for, a large number of special machines are required, which have to be designed and constructed in our own works. Standard machine tools of ordinary design are, of course, bought, being more satisfactory and less in cost. The multitude of small tools to keep nearly 1,000 semi and full automatic machines going require also quite a large establishment for tool making.

The Commercial Department.

The marketing of our goods calls for a considerable estimating, selling, booking, and forwarding staff, which is managed by the commercial department. As chains are used in almost every country where machines and factories exist, we have not only a large home and colonial or English-speaking department, but also a small foreign department, where the correspondence is carried on in two and three foreign languages. When the business was smaller, all the three main departments were mixed up together and constituted one workshop department. More efficient working, however, soon made separation necessary. To obtain a real and accurate cost of each class of goods, sub-divisions had to be carried much further than was at first deemed necessary.

Monthly Balance Sheets.

For some time we have also been preparing monthly balance sheets, not for the commercial departments alone, but also for the manufacturing departments, and have found them of very great advantage. These monthly returns kept one constantly informed as to how the business is going, and are a great comfort in normal times, and unmistakable signposts when things are not going as they should. With a proper accountancy system, the necessary indexes are constantly kept up, and the preparing of monthly sheets then becomes the work of a few days after the month is past. With such a system of monthly balance sheets and all the returns strictly kept up-to-date, in the commercial, drawing and cost offices, and in the various stock, store, and warehouse rooms, the preparing of the yearly balance sheet is a question of only a few days more. The stopping of work for a week or ten days, necessary with the old method of yearly stock-taking, is falling out altogether, and, as is usual, a very disagreeable time for everybody is saved.

Remuneration.

I have left to the last the very important question of the system by which the workers are remunerated. Many books have been written setting forth the advantages of this or that system, and no doubt many more will be written on this subject. The fact is, no one system can be applied to advantage throughout any engineering works. As a rule, the class of work done varies too much, and the methods as to how to remunerate the men has to vary accordingly.

Giving a short account of the methods we have adopted, I would say: From the beginning of our business, for many years, we have paid all our labor by day work, which is generally admitted not to be the best system to obtain the largest production. We have done this because our first aim was to get the highest quality it was possible to obtain rather than quantity. A fair return from our workers we tried to secure by great vigilance on the part of our foremen and superintendents, who, again, were under intimate personal control of the head of the firm.

To our mind, piecework could not well be adopted, because the necessary staff and system for inspection were not then established, and was very difficult to introduce with the constantly recurring changes and improvements in quality and method of manufactures. As everybody knows, frequent changes in workmen's rates of pay are very apt to lead to discontent and difficulties, and so we kept on paying our labor by time work.

Award System.

Now as our methods of manufacture are beginning to settle down into more steady grooves, and it becomes possible to standardize our goods and fix limits to work to, and to arrive at quantities that can be steadily produced, it has become possible to devise a working system complete with inspection and accountancy. Under these more stable conditions, we are working now a system for rewarding some of our labor by results. I say "some of our labor," for in every engineering works there must be always a smaller or larger number of men who can only be paid by time work. The reward system adopted rests, broadly speaking, upon the following principles:

(1)—A man doing certain work on certain machines is rated at so much per week. At one time these rates were fixed at the price at which a man could be got. We have now developed a schedule for wages which takes into account the skill, the length of time of learning, and the laboriousness of the work he performs. These rates he is guaranteed and paid year in and year out, according to the hours he works.

(2)—In addition to the above weekly wages, in one department, for example, we pay a reward for the work above a certain quantity. The quantity at which the reward begins is usually 75 per cent. of the highest possible quantity a machine could turn out if at work without any interruption whatever. This quantity is carefully ascertained by our production engineers and clearly explained and shown to the workman how it is obtained. The workman gets the full credit of what he does above 75 per cent., and when he reaches 90 per cent. he gets an additional 50 cents for the fact of having reached so high an efficiency. The speed at which the machine should run, the feed, suitable fixings, and spare tools are all carefully thought out by the production engineers.

An assorted number of necessary fixings and tools neatly stored in special boxes are handed to each machine worker. It is in connection with such studies that we have found what considerable economic gain is obtained when the machines are chain-driven—that is, have a positive fixed ratio of speed in relation to the prime mover, and are not at the mercy of the old-fashioned leather belt, which, when slack, easily shows a loss of from 10 to 30 per cent.

All this looks simple enough, and, in fact, if used with tact and reasonableness, is very simple indeed. We have not gone through this work and study without learning how difficult it sometimes is to use the necessary tact and patience. For want of a broader outlook, some men are more or less unreasonable, and do not even understand their own true interests, and then it is that an amount of patience and tact is required, which it is well-nigh impossible to command. Unfortunately, sometimes the masters also are not much more far-seeing than the men they ought to lead.

It is wonderful what a little common sense and a kindly spirit can achieve, and I can do no better than finish my paper by repeating what I have already said, that a systematic and successful shop management is neither more nor less than:

Educated common sense, applied with method, reason, and tact to every-day problems, as they arise in our engineering works, large and small.

MEMORANDA ON AUTOMOBILE CYLINDER FOUNDING.*

By Robert Crawford.

VERY few designers of automobile engines for gasoline give the foundry end of the work any consideration, and hence it is quite common to have light and heavy sections cast together. At times this could easily be avoided, yet often not. The consequence is that chills are used, which is a practice I do not favor. I would much prefer to change the design where possible, and for the rest rely upon careful cupola practice for this class of work.

The Cupola Feature.

The first thing to watch is naturally the cupola. Of all the difficulties with which the foundryman has to contend in his melting practice, there is really nothing simpler than the cupola, and the results are absolutely safe if he know the principles underlying its proper operation. He may buy the best pig iron and scrap, but unless this material is melted right, the results will be defective in the qualities wanted. Iron will be hot and dull in turns, the coke will get the blame, and the men most interested await the heat with constant dread.

The proportions in the cupola must be properly observed. There is only one given volume of air that operates to the best advantage for every cupola diameter. It is not the blast pressure that counts, but the blast volume. If through too much air, and consequent high blast pressure for the same charging method and material, the lining is cut out badly, this should be looked after. Linings cost money, and a good blast arrangement should mean relining only once a year.

Next, by using small charges and with a proper bed thickness, there is no reason for pin holes or internal shrinkage in the work you make. It is a great mistake to work for a high melting ratio. Some men make it one to ten and others one to eight. There is but one correct ratio for each cupola and method of running to give good hot iron free from trouble-making characteristics, and when this is found, it should be held until the coke or melting stock is changed.

The importance of iron free from pin holes and shrinkage for automobile cylinder work cannot be over-rated. Those who save coke and hence melt down too low in the melting zone will realize this when they run across such castings as a piston, for instance, which may have passed through every operation up to the drilling of the hole for the wrist-pin. The inspector finds what he calls a sand hole. Study it closely and you will find it to be the result of gas in the iron. The metal has been burned in the cupola.

Another point is the great advantage of prevention as against cure. It is far better to melt right than to attempt to correct a ladle full of iron with alloys. The latter, in deoxidizing the metal, also chills it sufficiently to hold the dross and oxides formed in suspension until set, thus defeating the very object of the process.

When the cupola is kept in blast longer than two hours, it is essential that it be slagged off. Limestone of good quality cannot be excelled for this purpose. For ordinary run of melting stock, about fifteen pounds to every thousand of metal is all I use. With proper charging methods, there will be little bridging of the cupola, and hence no serious damage to the lining from the chipping necessary after a heat.

Pig Iron and Scrap.

It goes without saying, that, for automobile cylinder work, the pig iron piles should be under control as to chemical composition. You should know what your daily product analyzes, and you should further train your eye, that with a knowledge of the analysis you can note from your fractures if anything "off" is apparent. For this class of work—and I make the several parts for about fifty automobile and marine engine manufacturers—the iron should have as little shrinkage as possible, possess great durability, and show good machining qualities. I make hard iron just as every one else does at times, but, when a "kick" is registered, I investigate and straighten the matter out as rapidly as I can.

The unfortunate situation in the automobile industry is that the purchasing agent looks for cheap castings, and the foundryman simply has to use a lot of scrap of which he knows little or nothing. The result is a wailing in the machine shop which is not good to hear. Those who know will not be bluffed into this way of doing business. They will use the best of materials and charge their price. Not only has the temptation to quote a low price and then make up by using cheap scrap caused much disaster, but the advent of the automobile engineer has given us 5-32 in. and 3-16 in. water jackets, where 7-32 in. and ¼ in. had been the rule. The great strain from vibration and the gas explosions put on the cylinders, pistons and rings has proven conclusively that it is wise to start with a good foundation in the way of raw materials, and then to melt them right.

Charcoal Iron.

As to the use of charcoal irons for this class of work—being nearer to the charcoal iron market than our Eastern foundrymen—I will say that from the nature of its making, it is purer, wears better, is a close iron which will polish like steel and not cut piston or rings. On account of the expense, it is necessary to mix with coke irons, but in doing so, while making the mixture, see that the composition corresponds to the design. Melt hot and pour hot. If the metal cuts the mold, face this with material that will stand hot iron. Hot iron always gives a better casting than dull iron.

Unique Ways of Doing Things in the Machine Shop. Readers' Opinions Concerning Shop Practice. Data for Machinists. Contributions paid for.

RECUTTING FILES.

WHEREVER a great amount of bench work is done, files are continually finding their way to the scrap heap before their usefulness has really been fully exhausted. When a file becomes a little dull, it is a standing invitation to poor work, and if there is any chance of obtaining a new one it is a guaranteed fact that it will not be used any longer than necessary. Some employees have a prejudice against using files that have been recut in any manner, and, of course, for fine work, they are not to be recommended. It is not necessary, however, to inform those men of the quality of the files they are using, and many of them cannot tell the difference. It certainly is a great saving to have the old files turned in and carefully sorted out so as to properly determine their disposition.

The files are first carefully cleaned of all grease and chips. A solution is made in the proportion of one part sulphuric acid to four parts of rain water and kept in a large earthenware jar. The files are immersed in this solution for varying lengths of time depending upon their condition and the pitch of the teeth. They are rinsed in warm water after being taken from the solution so as to remove all traces of the acid, then dipped in machine oil, and dried in sawdust. When carefully done, a satisfactory job will result in the majority of cases. Of course, some experimenting will be necessary to determine the exact length of time for immersion in the solution. Should the files be left in the solution too long or if the latter be too strong, the points of the teeth will be eaten away unevenly. They should be left in just long enough to bring back the cutting edges of the teeth, and if properly done, files can be recut by this method from three to four times.—D. O. Barrett.

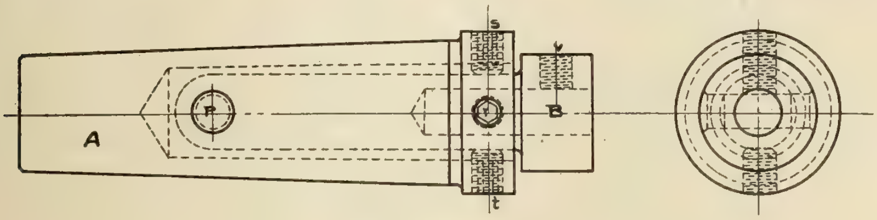
Jig Boring Tool.

The cut shows a boring tool for use on a milling machine, and which is of simple design and easily and cheaply made. The body (A) is bored out to take the tool holder (B), allowing clearance at the sides, as shown. (B) is pivoted at the back and on the pin (P). The set screws (r), not shown in the end view, bear on flats on the sides of (B), preventing any side motion. The screws (s) and (t) form the means of adjustment, swinging the holder about the pin (P) and giving the necessary range. To get the greatest range, the job may be started with (B) clear over to the one side. At the back end (B) is prevented from moving sidewise by collars on the pin (P).—D. O. Barrett.



JIG BORING TOOL.

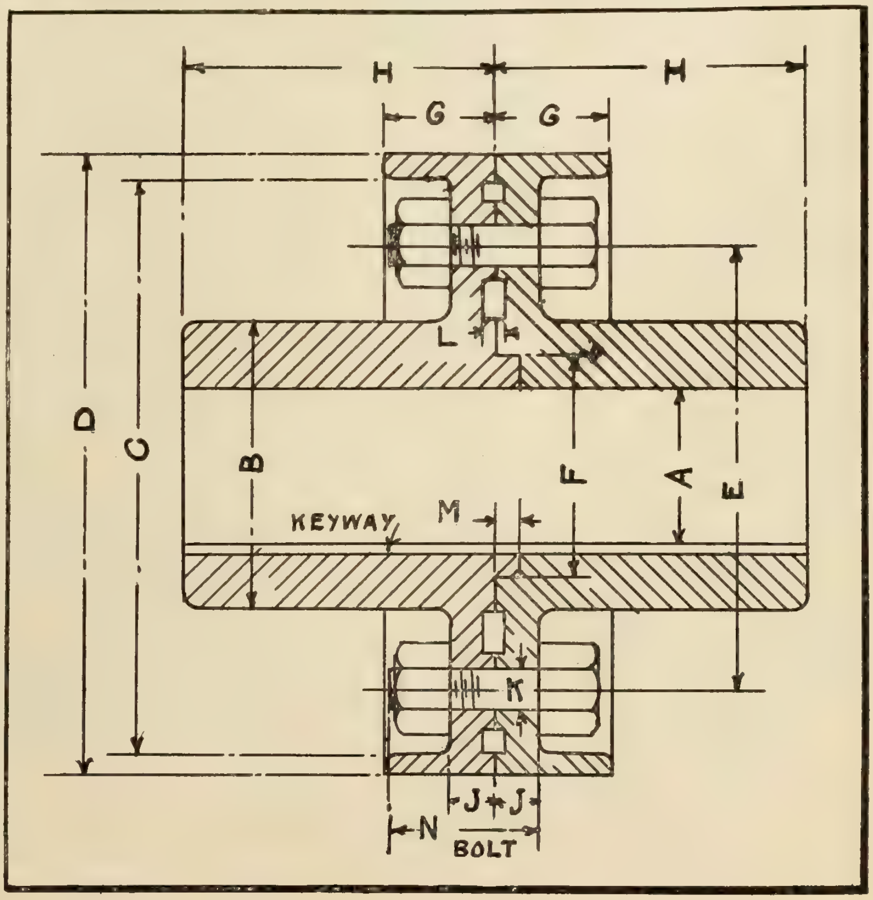
Templet and Plugs for Tapping Holes.

The best way when tapping out holes by hand on parts having planed or milled surface, is to use a templet and plug, for then the holes are always tapped true. Generally the templets used for this purpose are square pieces of steel or cast iron, having one or more holes in them. The plugs are of several varieties of length and size generally, but at best such outfits are make-shift affairs.

In the enclosed sketch is shown a neat set of plugs and a templet that can be made up and used for the purpose indi-

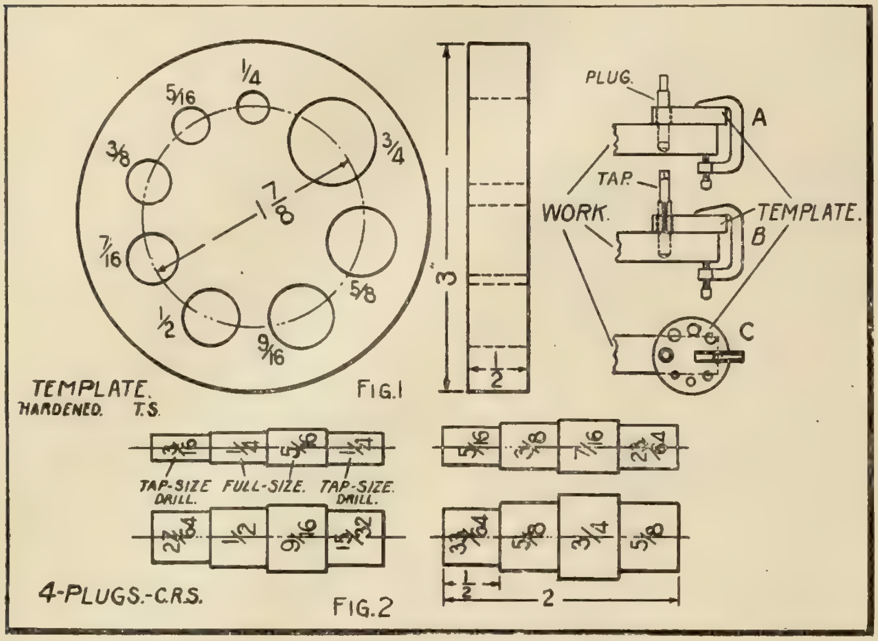
FLANGE COUPLING DATA.

A	B	C	D	E	F	G	H	J	K	L	M	N	Key	Bolts
1 11-16	3¼	6½	7	5	2½	1¼	3½	½	½	¼	¼	1¾	⅝	5
2	4	7½	8	5¾	3	1½	4	¾	⅝	¼	¼	2	⅝	5
2	4½	8¾	9½	6¾	3½	2	5	⅞	⅝	¼	¼	2¾	⅝	5
2	5½	11	11½	8½	4½	2	6	1	¾	¼	¼	3	¾	5
3	6½	12	13	9¼	4¾	2¼	7	1¾	¾	¼	⅜	3½	¾	6
3	7	14	15	10½	5⅛	2½	8	1½	⅞	¼	⅜	3¾	1	6



cated. Fig. 1, the templet, is a tool steel disk, 3 in. diameter and ½ in. thick, having 8 full size holes for taps ¼ in. to ¾ in. inclusive. The edges of the holes are about ¼ in. apart. The end diameters of the plugs, Fig. 2, are made tap-drill size for U. S. standard taps.

The method of using the templet and plugs is as follows:—The templet with a hole of the same diameter as the tap to be used is placed over the hole to be tapped in the work; then a plug having the same diameter also as the hole in the templet, and whose end diameter is the same as the hole in the work, is inserted in these two holes, locating them together. The templet is afterwards clamped to the work, the plug removed, and the tap put in, as shown at (A) and (B), (C) is a top view of the templet clamped to the work. When the tap has become started-in sufficiently to require no guide, the templet should be removed to save wear both on itself and on the tap teeth.—James E. Cooley.



TEMPLET AND PLUGS FOR TAPPING HOLES.

Boring Out Engine Crossheads.

I was put in charge of a machine shop building steam engines. One of the first things I noticed was the haphazard way the crossheads were machined; hardly ever two being interchangeable. The method in operation was to bore the gudgeon pinhole with the casting fixed on parallel strips on face plate. In boring piston rod hole, the casting was reset on strips with the gudgeon pin hole parallel with the face plate. All the holes were bored with flat drills, and the whole method employed was dependent upon the skill of the workman. My idea was to provide jigs and tools whereby it would be difficult to go wrong.

The first thing I did was to make a new crosshead pattern of cast iron. I had it properly machined and finished, so as to ensure a good clean casting to work from. Fig. 1 shows crosshead, while Fig. 2 illustrates the tool-holder and drill guide for boring and facing piston rod hole.

To make the drill guide, secure a piece of wrought iron, machine it on bottom, and drill out hole so as to pass a cutter bar through. It is next bored and faced to take a hardened steel bush. The boring must be done with the boring bar on the lathe centres, also in the lathe on which it is intended to use the guide. When this has been done, drill holes for dowel pins where convenient, as these will save a lot of time in setting. Fig. 3 is the jig for drilling the gudgeon pin hole, the sketch showing plainly the construction. No spanners are necessary to fix the casting in jig, it being held rigid with knurled screws. The plate marked (A) is a swing attachment, one turn of the wring nut allowing the casting to come .. of the jig. Fig. 4 is an easily made jig, the spigot being made to fit recess in face plate. When boring hole marked (A), it must be absolutely square with face. Fig. 3 was used in a drill press, and Fig. 4 in a lathe, the reason being that these two machine tools adjoined each other, and the drill press was not, in this case, considered capable of drilling the piston rod hole. Fig. 5 shows the casting ready for boring in the lathe.

When preparing to bore, fix in jig and set with adjusting screws. Drilling can then be started, as no other clamping is necessary. Bore out with drill .010 under standard size and finish with reamer. Face up with tool held in drill guide; this saves time in changing. Accurate work and increased output were the result of the foregoing equipment in service.—W. Womersley.

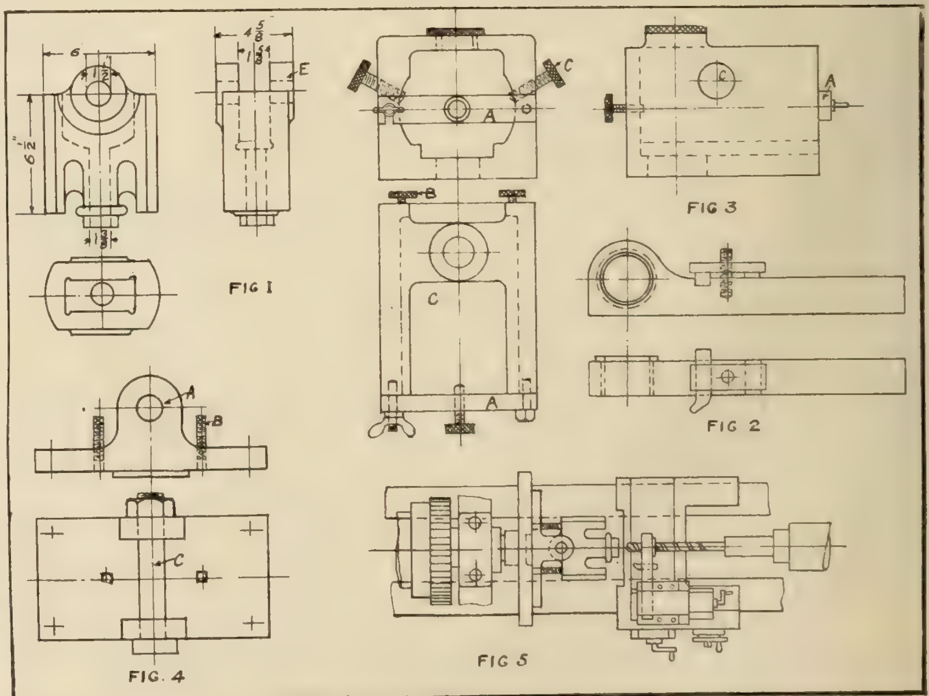
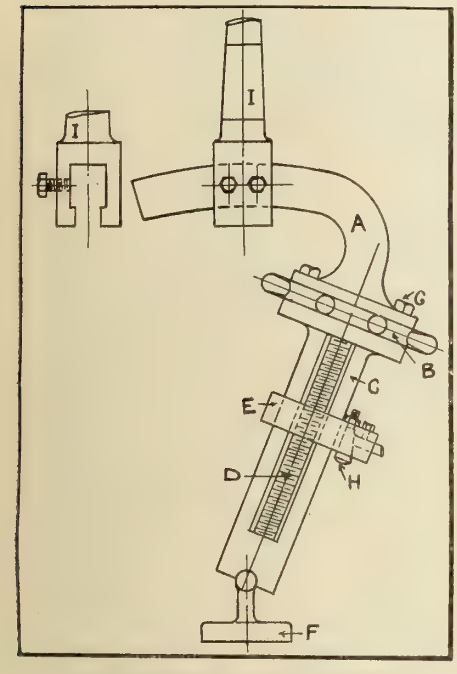
Taper Boring on the Drill Press.

A good tool for boring large taper holes is here shown. The head is made to fit the machine spindle, and arm (A) is made to fit the head, being held in desired position by set screws. Self-feed is effected by the star arrangement (B),



BORING OUT ENGINE CROSSHEADS.

a striking rod being fixed off the drill press table. The part (C) is attached to arm (A) by three small columns (G), these columns being of such a length as to allow the star (B) to move freely. The end of the feed screw (D) contains a small pinion which gears into another pinion (J) and star (B). The tool holder (E) is made for ½ in. square tools, and the depth of cut is regulated by the cotter (H). The feed nut is held to the tool holder by means of bar (K), while the centre (F) is fastened to the drill press table. The ball end of the latter must be hardened.—H. Womersley.



DRILL PRESS TAPER BORING APPARATUS.

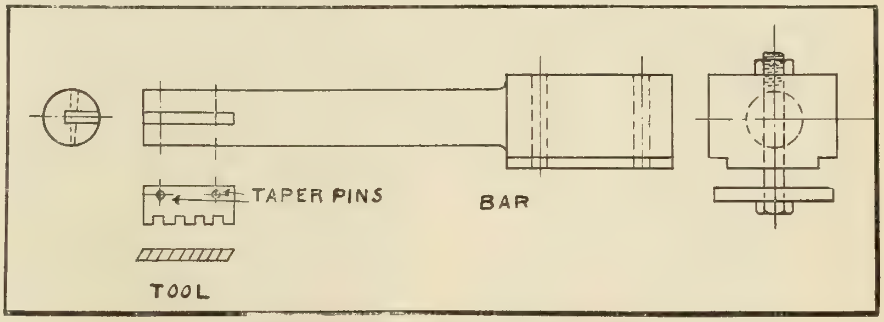
Quadruple Threaded Nut Kink.

The following is a little kink which may not be new, although I have never seen it applied as herein given:—We recently bid successfully on a job in which was included a lot of brass nuts 1½ in. lead quadruple thread. The usual way of cutting a quadruple or other than single thread is to make some indexing arrangement either on the face plate or with the lathe gears so that the threads will be accurately spaced when cutting with a single pointed tool. The quantity we had to make was large enough to stand the cost of making special tools, which we did, and we saved thereby enough time to pay for the tools and add to our profit.

We made a good stiff boring bar out of 2 in. square iron; turned up enough of one end to go through the job and planed the square end with a tongue to fit on the slide rest so as to keep it from twisting under the strain of the cut. We milled a slot in the tool end, into which we inserted a five-toothed piece of tool steel to cut the thread; the teeth being spaced and milled for the lead and angle of the thread. In cutting the thread, we set the lathe gears for the required lead, and used the tool in the ordinary way, but instead of cutting one groove at a time we cut four (the fifth tooth on the tool was merely precautionary in case of breakage), finishing the thread complete in quarter the time taken if doing it the ordinary way. It would not pay to make this rig for a small quantity, although in some cases it would be as cheap as an indexing jig. The writer is of the opinion, however, that this method of cutting quadruple or triple threads will appeal strongly to certain of our railroad shop readers, and is certain that the method is not in use in a town where there are three locomotive shops.—Retals.



QUADRUPLE THREADED NUT KINK.

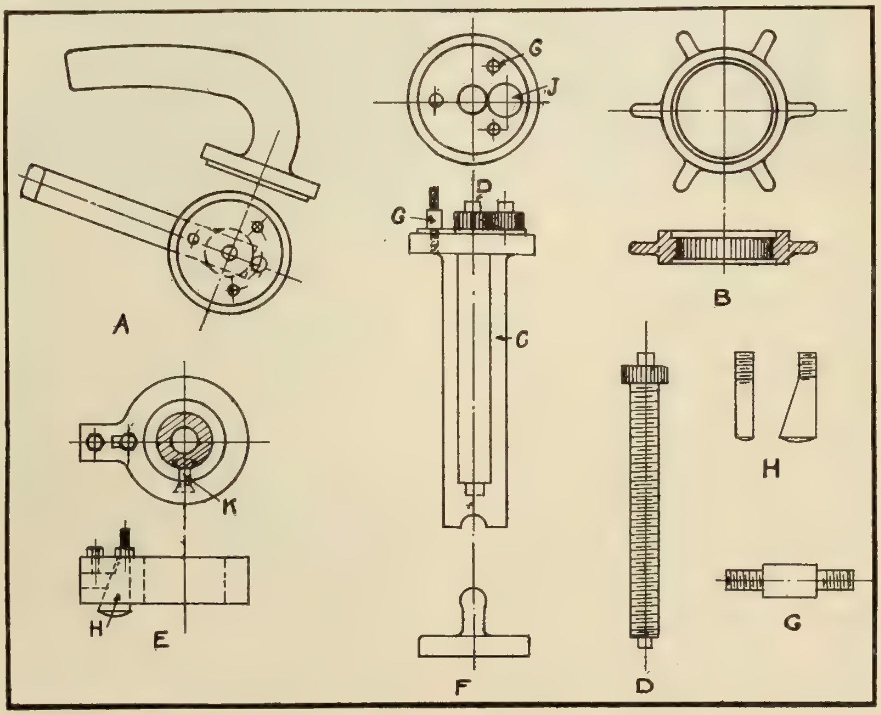
Stationary Engineer Certificates.

In a little while it will be necessary for men operating stationary engines in the province of Quebec to know something about an engine. If the bill that the Hon. Mr. Taschereau, Minister of Public Works, is framing passes the House, operative engineers will in future be required to pass a difficult examination before a Provincial Board to secure a certificate. At present certificates are granted, but it does not require much skill to secure one. Under the New Law, stationary engineers' certificates will be classified in three or four grades, and the granting of these will be in the hands of an efficient Board, the members of which will hold periodical examinations in different parts of the Province. It is hoped that this step will lead to a reciprocal arrangement by which the holder of a certificate in Quebec will be recognized in other Provinces as being qualified to have charge of a stationary engine. This reform has been effected by the stationary engineers of Montreal and Quebec city, who are to be congratulated. For a long time they have suffered an injustice because certificates were being granted following examinations which are alleged to have been far too elementary. These certificates will be renewable every year.



DRILL PRESS TAPER BORING APPARATUS DETAIL.

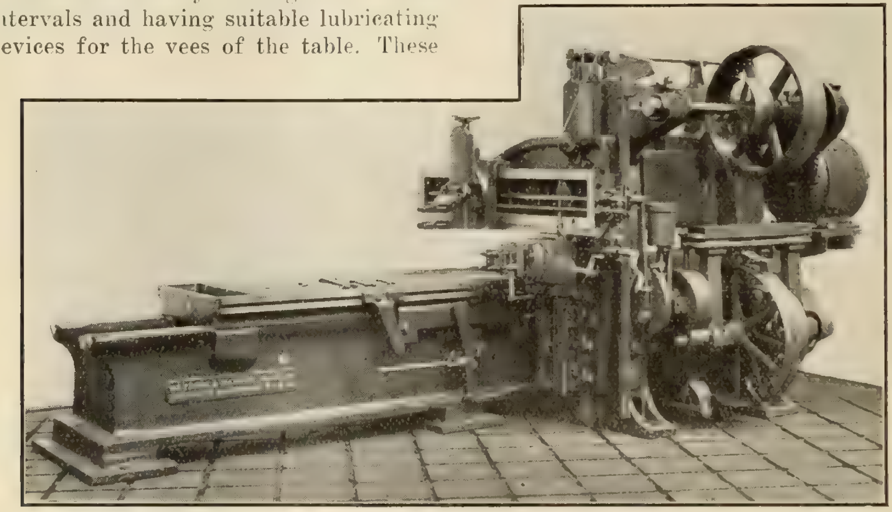
DEVELOPMENTS IN MACHINERY

A Record of New and Improved Machinery Tending Towards Higher Quality and Economical Production in the Machine Shop, Blacksmith Shop or Planing Mill.

NEW 36-IN. OPEN-SIDE PLANING MACHINE.

A THIRTY-SIX inch open-side planing machine of somewhat unusual construction has been developed by the Detrick & Harvey Machine Co., Baltimore, Md. This machine was designed to conform to the Government specification for the naval repair ships and three have already been installed. The machine was required to plane a surface 36 in. wide on a piece 24 in. high and 8 ft. long. It is provided with a head on the cross rail, having hand and power, horizontal, vertical and angular feeds, and a side head having vertical hand and power feeds and a horizontal hand adjustment. By placing the cross rail head at an angle, the width of the surface which can be handled by the machine is increased to 50 inches.

The bed of the machine is a single piece reinforced by cross girts at short intervals and having suitable lubricating devices for the vees of the table. These are spaced 21 in. on centres, and are 4½ in. wide at the top, with an included angle of 90 deg. The bed measures 152 in. between the end pockets and contains the bronze bushed bearings for the driving shaft. The table is 32 in. wide, 8 in. deep and 8 ft. long between the end pockets. Three planed T-slots are provided in the top, as well as a number of rectangular cored stop holes. It is gibbed down on both sides at the cutting point to prevent lifting.



DETRICK & HARVEY OPEN SIDE PLANER.

The post is of box cross-section, reinforced at both the front and the rear for the full height by extensions. It extends to the floor line as the chief supporting member of the principal parts, and is tongued and bolted to a cheek on the bed, this arrangement of vertical rib being relied on to offer direct resistance to the pressure of the cut and reduce the torsional strain in the post to a minimum. An L-shaped casting, having a vertical leg bearing on the face of the post 11¼ in. wide and 51 in. long, is used for the cross beam. The length of the vertical support of the cross beam is approximately 1 1-3 times that of the overhanging arm, and the horizontal face is cast integral with the vertical leg.

A triangular brace secured to the rear surface of the overhanging portion and extending to an inner face on the rear of the post furnishes an additional support for the cross beam, it being possible to securely clamp it in place. The portion of the vertical leg of the cross beam which projects down from the horizontal slideway has a slideway on its front face for mounting the side head, this arrangement being employed to reduce the distance from the cutting tool to its final supporting member to a minimum.

The drive is of the Sellers worm-type and the machine is driven by a 10-h.p. constant-speed motor. This is direct connected through a silent chain drive to the countershaft bracket attached to the planer post. The countershaft revolves in a plane parallel to the line of table travel and the power is then transmitted through a pair of bevel gears to a diagonal shaft upon which is mounted a multiple thread worm, engaging the rack under the table. The speed of the worm is 2.08 r.p.m. and that of the machine pulley is 7.20, which gives a belt speed under the cut of 57 ft. of 2¼-in. belt per foot of table speed. The cutting speed is 50 ft. per min., while the return speed is 40 ft. higher. A positive friction type of feed mechanism is employed, which consumes power only when feeding.

The floor space occupied by the machine is 9 ft. in width and 20 ft. in length, including the extreme travel of the table. The over-all height is 83 in. The machine, together with the driving motor, weighs approximately 21,000 lb.

◆

NEW THREE-HIGH UNIVERSAL MILL.

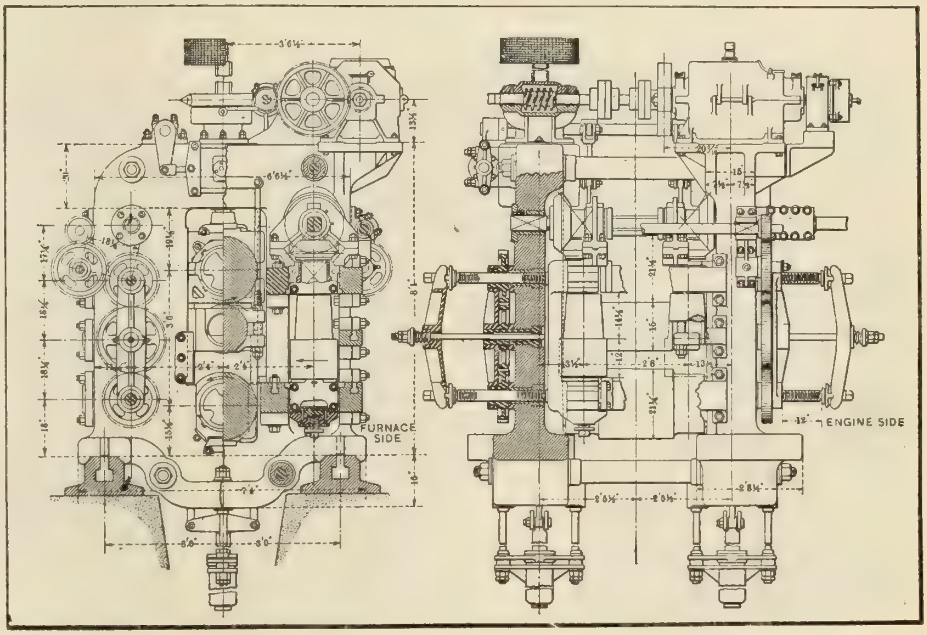
THE Harrisburg Pipe & Pipe Bending Co., Harrisburg, Pa., have recently designed and built a new three-high 21 in. Universal Mill for their rolling mill department. This new mill takes the place of an old 20 in. grooved mill, and is designed to roll plates from 4 in. to 18 in. wide down to .072 in. thick or No. 15 gauge.

It was decided to build this mill during the early part of June of this year, and the first slab delivered to the mill on September 29 was successfully rolled to width and gauge. This is somewhat remarkable both as to time and successful operation when the limited resources of the company for doing this class of work, both in the engineering department and shops, is taken into consideration.

This mill is of very heavy construction throughout, all of the parts being made over size wherever possible. The housings are made of air furnace iron and are exceedingly heavy in order to give the mill great rigidity. The boxes and practically all of the fillings are made of steel with all bearings bushed in order that repairs may be easily and quickly made. Realizing the necessity of changing the middle roll quickly, the bearings for this roll are made removable from the outside, and by means of a special balancing apparatus, this roll can be removed from its position and a new one put in place in a very short time. The vertical rolls are also designed with the idea of rapid removal.

In order to make this change, the bonnets are removed from the yokes carrying the bevel gears, the rest bars from the front of the mill are removed, and the vertical rolls taken from their housings and new ones put in their place. Special attention was paid to the bottom vertical roll bearing, which, as a rule, gives considerable trouble in mills of this type. The bronze bushing is so designed that it extends up into a groove turned in the body of the roll so that the bearing is absolutely protected from all water and scale. Positive lubrication of this bearing is secured through a hole in the centre of the vertical roll running its entire length. Judging from the small amount of wear on the vertical rolls and their bearings during the first 5 weeks of operation, they should last several months before their removal from the mill. The working body of the vertical roll is 14½ in. in diameter with an 8 in. diameter neck.

The main rolls are 21¼ in. in diameter with 14 in. necks, giving a very rigid roll on account of their shortness, the length of the working body of the roll being only 23 inches. The top roll is balanced in the usual manner by means of two hydraulic cylinders under the housings. It will be noticed that the middle roll is lifted by means of a hydraulic cylinder on the side of the housing, permitting of easy access for packing and making the necessary adjustments. Both the top and bottom main rolls are provided with wedges in order that the mill may be accurately leveled and the material delivered straight. On account of the small amount of adjusting required on the vertical rolls, it will be noted that ratchets are provided for their movement in and out, although their design is such that motors may be applied at any time should occasion demand it.

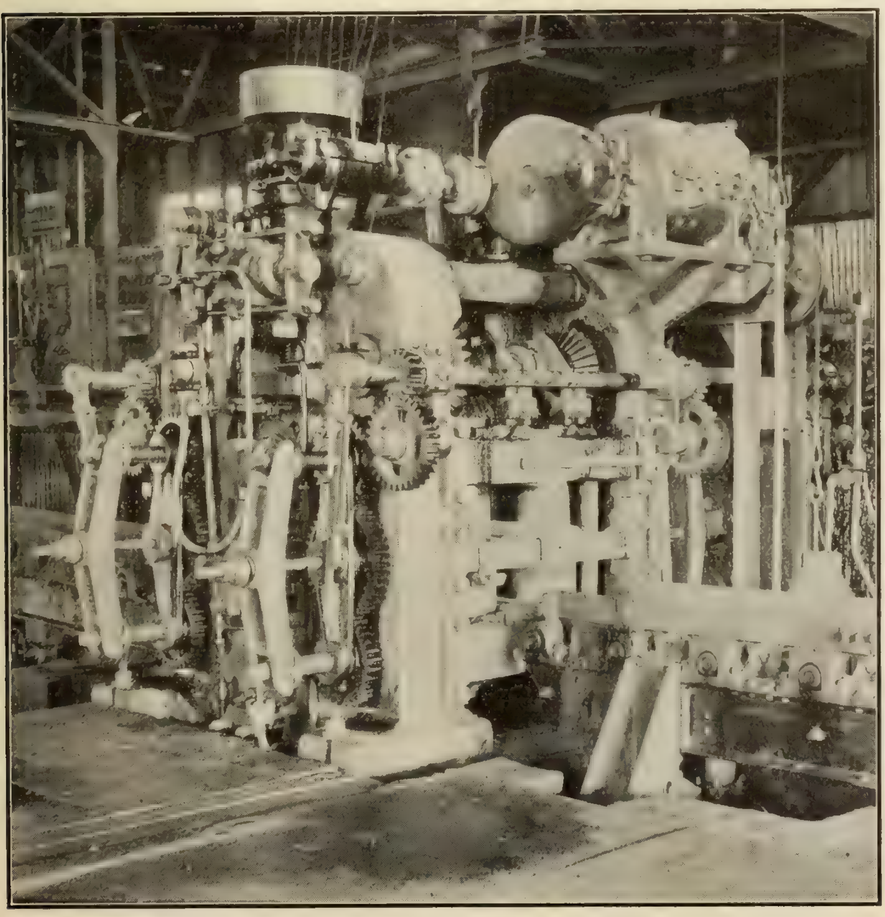


THREE HIGH UNIVERSAL PLATE MILL—CROSS SECTIONAL ELEVATIONS.

The screw-down on this mill is somewhat faster than called for by ordinary practice, the 35 h.p. Westinghouse M.C. mill motor being connected to the screws with suitable gear and worm in a 16 to 1 ratio. The motor is operated with a General Electric magnetic switch control and an Electric Controller & Mfg. Co. brake. It has been found with this control apparatus that the production of the mill is not limited or retarded by the screwsman, but is governed only by the speed of the rolls and the ability of the table runner to handle the bars in and out of the mill. The mill is operated in conjunction with a three-high bull head stand, which serves as a finisher. This bull head stand is also of a very rigid construction, and is so arranged that three reductions are obtained on it, enabling the plate or bar to be reduced to one-half its thickness.

With these two mills operating, one as a rougher and the other as a finisher, it is possible to roll down to light gauges, and at the same time produce material that is very accurate as to gauge, and also with a very fine surface finish free from scale and other defects. The necessary equipment has also been installed to ship the product of these mills in lengths cut to order or in coils as the customer may require.

The steel for this mill is made in small basic open hearth furnaces of 40 tons capacity, with the sulphur and phosphorus content running not over .03 per cent. On account of the steel being made in small furnaces and from selected pig iron and scrap, it has been found that the product of this universal mill is particularly adapted for stamping, deep drawing and cold rolling processes, or for any work where a steel of accurate analysis and great uniformity is required.



THREE HIGH 21 IN. UNIVERSAL PLATE MILL.

FLEXIBLE METHOD OF SUPPORTING SHAFTING FROM CONCRETE BEAMS.

VARIOUS methods have been employed for the support of shafting in concrete factory buildings. Most of these have been based on the use of some form of insert, and practically all of them have made it necessary to determine in advance the exact location of shafting, and have not provided any flexibility to allow for future shafting, changes or additions.

An interesting method of securing the latter, which has been used by Lockwood, Greene & Co., architects and engineers, of Boston, Mass., is clearly shown in the accompanying photographs. By this plan, a continuous groove about one inch deep and about two inches high is cast along each side of every concrete beam in the building. These are located at a uniform height from the bottom of the beam and are of uniform size. The grooves are easily made by simply nailing a cleat inside of the forms before the concrete is poured, and since the slots come, in general, below the upper half of the beam they do not detract from its strength. This method does not add appreciably to the cost of construction, and the grooves are not very noticeable.

Clamps have been designed which fit around the inside of the beam and are held in place by bolts with plate washers at the top which fit into the grooves in the beams. The clamps are made of gray iron, and it has been found that they can be cast very cheaply after the pattern has once been made. Two of these clamps are necessary for each hanger, and since the clamps are made up independently, a pair can be spaced any distance apart, and thus be made to accommodate the foot of any hanger which it is desired to use. The photographs clearly show the form of the clamp, and the appearance of a line of shafting supported in this manner. When an intermediate hanger is desired between beams, a clamp of the same style may be used to support steel channels to which the hanger is then bolted as shown in Fig. 3.

The particular advantage of this method, which is in successful use in a number of factories, lies in its flexibility in providng for changes and for future requirements.

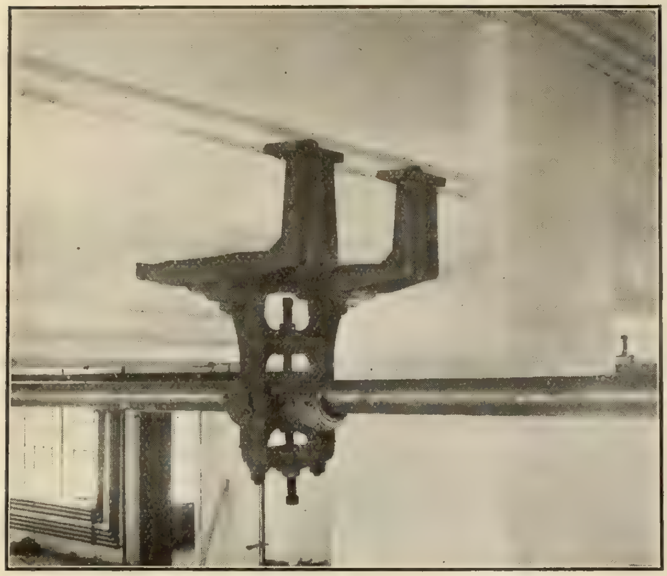


FIG. 1. HANGER AND CLAMP AT CLOSE RANGE.

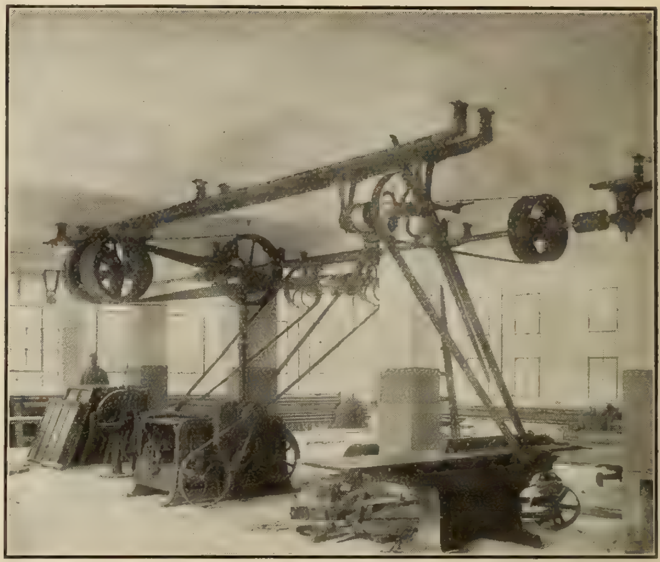

FIG. 3. INTERMEDIATE HANGER ARRANGEMENT.

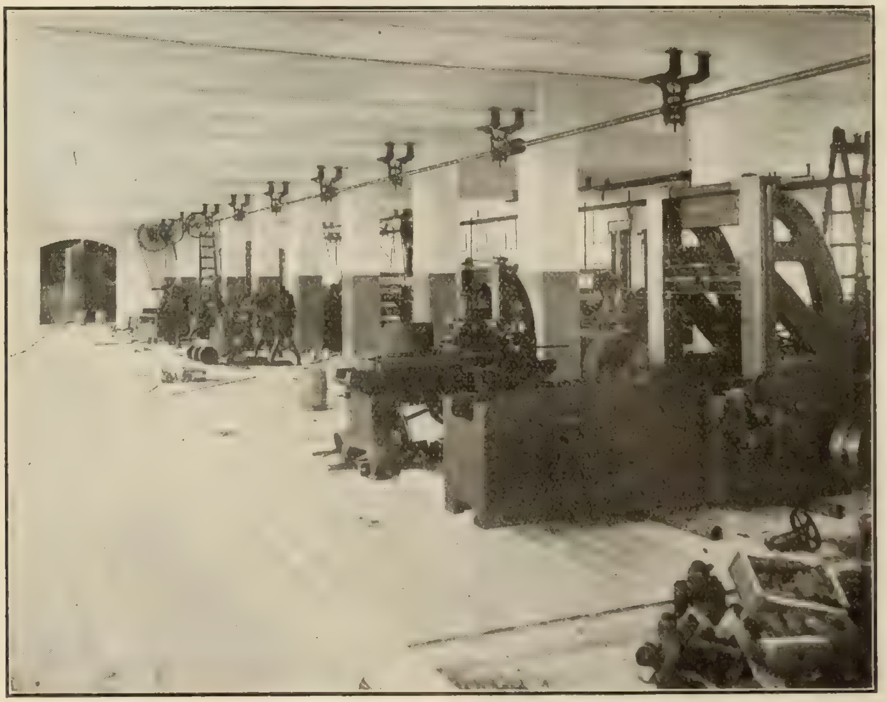

FIG. 2. LINE SHAFTING INSTALLATION IN MACHINE SHOP.

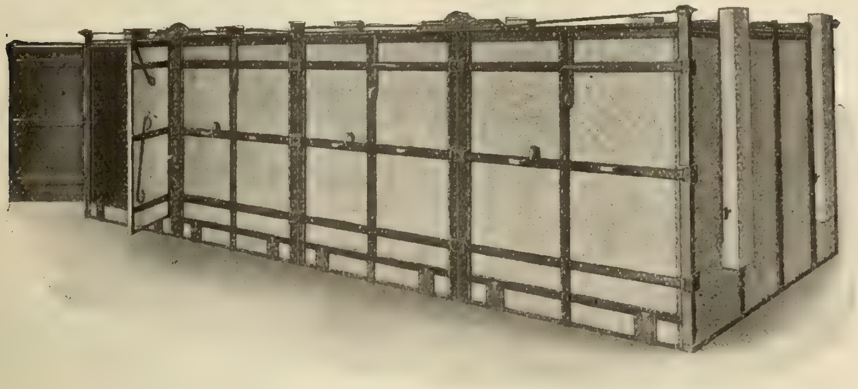
BANK OF NEW CORE OVENS.

FOR operation by means of trucks holding from three to four tons of cores each, a new bank of ovens has just been installed for a foundry in Cleveland, O., by the Oven Equipment & Mfg. Co., New Haven, Conn. The whole equipment measures 28 feet across the front, 12 feet deep and 6½ feet high above the tracks. There are two compartments with a solid division wall between, each having two double full width doors to admit a truck of cores, which takes the full door opening.

Each compartment is heated evenly by an enclosed flame gas burner located at the centre and operated from the back side of the oven. Air under a pressure of about one pound is forced through the burner by a positive pressure blower. The superheated air thus formed makes thorough circulation throughout the entire interior of the oven, and forces steam and fumes out at the vents, such as those shown at the right end of the cut. The positive circulation and high temperature carried by this oven make it possible, we understand, to get results in one-half the time required when coal or coke is used. The insulation, covering all six faces of the oven, prevents the escape of heat and makes the operation extremely economical in gas.



BANK OF NEW CORE OVENS.

Among the safeguards, three in particular, might be mentioned: The enclosed flame gas burner removes all danger of fire from the burner under the apparatus. The gas is burned in a steel pipe, there being no open flame anywhere. In connection with this is the automatic cut-out valve which shuts off the gas pressure whenever the air pressure falls below a predetermined point. In this way it is impossible for gas to accumulate in the oven and cause an explosion as a result of a sudden failure of the air pressure. The doors are so adjusted that they cannot be closed unless the vent dampers are open. This prevents putting a pressure on the oven without any escape for the gases.

◆

UNIVERSAL MACHINE VISE.

THE description and illustrations refer to the Universal Machine Vise manufactured by the Brown Engineering Co., Reading, Pa.

These vises are made with deep jaws in order to assure perfect vertical alignment of any work which they are called upon to hold. The rear jaw swivels, offering four different faces to the work at any angle, while supplementary jaws are arranged to be bolted to the broad top faces of the vises for holding work of irregular shape. The top of the vise can be drilled and tapped for holding bushing holders when the vise is used as a universal jig.

The vises are designed to save the time of high-priced workmen, otherwise wasted in hunting for clamps, angle plates, bolts, etc. They are useful in making up jigs, and are employed in the tool rooms of many large plants for this purpose. They are very useful for making up special tools, due to the fact, that they will hold almost any shape which may come up. The work can also be extended down through the base of the vise, there being a hole in same for this purpose.

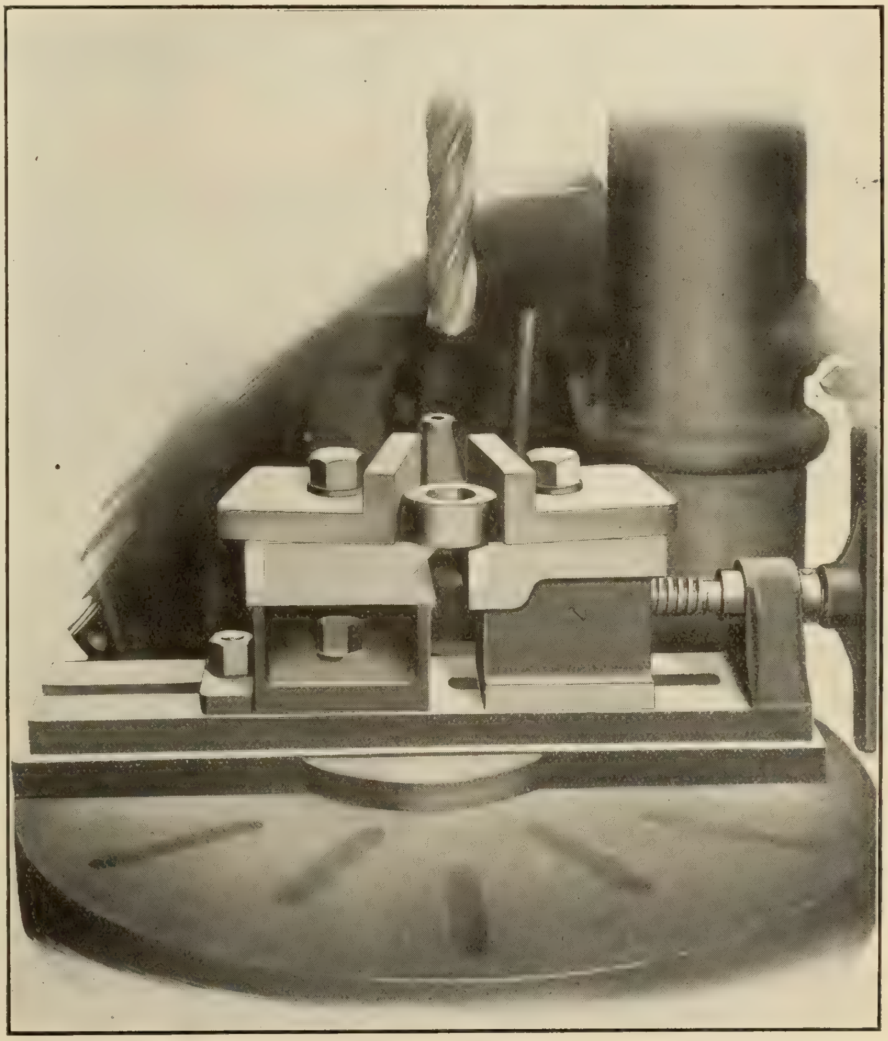
For use as a jig in contract shops, manufacturing plants, and others, where 50 to 100 parts are to be drilled alike, it is a simple matter to fasten a bushing holder to the broad top of the vise which is machined off for this purpose. A stop is easily fastened to the side of the vise for properly gauging the work.

For repair work, they fill an important place, being able to hold almost any irregular shape quickly and accurately.

◆

WET TOOL GRINDER.

THE 14 in. wet tool grinder here described and illustrated, has self-oiling bearings throughout. It is equipped with a vertical centrifugal pump, of snail shell design, which furnishes a constant supply of water that can be regulated to meet the requirements of all classes of work. The pump cap sleeve, which covers the pump case, loosely encircles the pump shaft and extends above the water line, thereby preventing leakage without the use of packing. The pump is driven by means of a friction pulley, which engages a flange on the inner side of the spindle drive pulley.



UNIVERSAL MACHINE VISE APPLIED TO DRILLING MACHINE.

The tank is located in the column and holds an ample supply of water. An opening in the base provides means for cleaning same when necessary.

14-IN. WET TOOL GRINDER.

This machine is built by the J. G. Blount Co., Everett, Mass., and is similar in design to their 20 in. and 30 in. wet tool grinders, but lighter in construction, tending thereby to meet the requirements of factories having lighter work. The machine can be motor driven, and occupies a floor space 32 x 24 inches.

SELF-OILED 22IN. ALL-GEARED DRILL.

THE Barnes Drill Co., Rockford, Ill., are placing on the market about the first of the New Year a self-oiled, 22-inch all-geared drill, concerning which the following description and illustration give an indication of the more prominent features. It is strictly a manufacturing drill, being strong, rigid and powerful, and built for rapid production and heavy duty. Every bearing, aside from the spindle sleeve, is self-oiled. There are eight changes of geared speeds and ten changes of geared feeds, all under instant control of the operator from front of machine. There are no cone or inherent belts to buy, slip, shift, or maintain; it is, therefore, positive and result producing in every movement. It handles high speed twist drills from ½ in. to 2 in. at suitable speeds and feeds.

All bearings, aside from the spindle sleeve and cross spindles, are automatically lubricated. Oil is pumped by a geared pump in the reservoir of the machine and distributed constantly to all gears and bearings, including the crown gears and feed box. This self-oiling system is manufactured under license from the Kearney & Trecker Co., owners of U. S. Letters Patent No. 834,063, dated October 23rd, 1906.

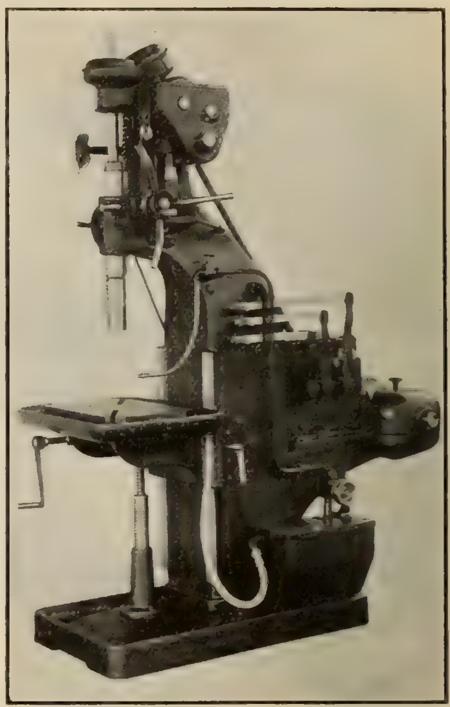
All transmission gears, aside from the friction clutch gears, including the crown gear and pinion, are cut from a special high grade steel, and are heat-treated to prevent wear and to increase strength and stiffness. There are eight changes of speeds, all controlled by levers within instant reach of operator from his position in front of the drill. The spindle may be stopped by placing shifter lever on neutral position or by throwing out the clutch gear.

There are ten instant changes of geared feeds, controlled by levers directly in front of operator, and feeds are indicated in plain figures on index dial plate. All important feed gears are cut from steel and are case-hardened. The feed gears are flooded with oil automatically. A safety collar protects the machine against damage from overload.

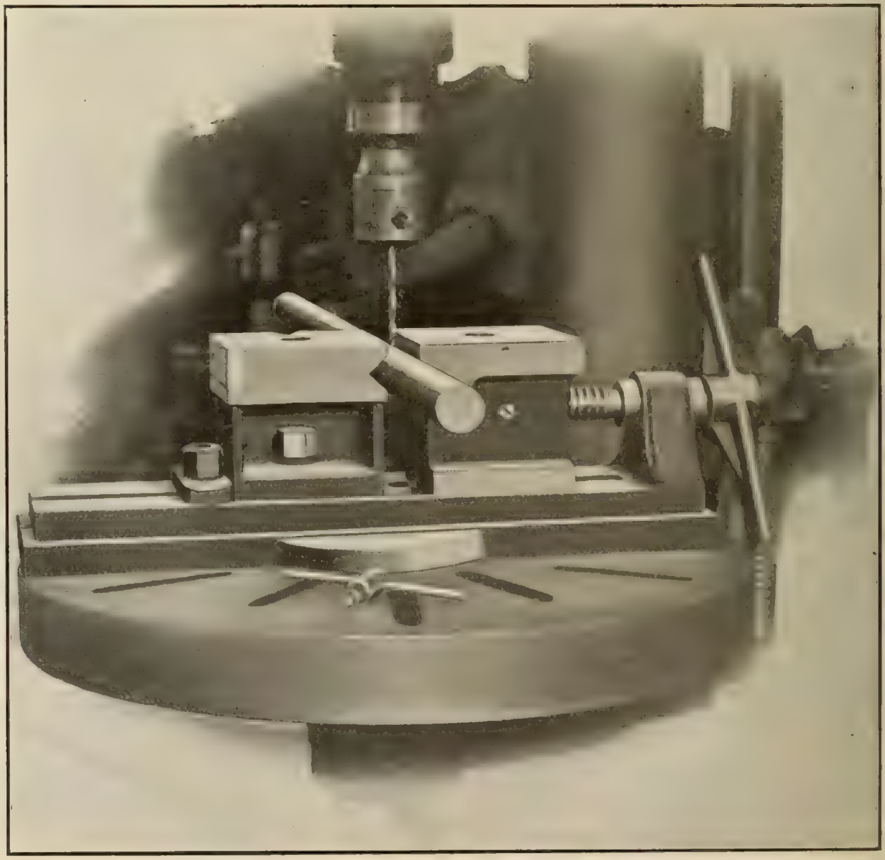
The ten feed changes are: .003, .005, .009, .013, .017, .020, .041, .065 and .093; while the eight speed changes are: Direct, 575, 456, 367, 233, and with back gears in: 144, 114, 92, and 58.

The machine is capable of driving a 13-16 inch Celfor high speed drill, running 575 r.p.m., with a feed of .041 in., through a 2 in. cast iron bar in 5 seconds, or equal to almost 24 in. per minute. It drives a 2 in. high speed drill at 144 r.p.m. with a feed of .025 inches.

The height of the machine is 85 inches, the floor space occupied is 65 by 31 inches, and the net weight, including regular table and oil pump attachment, but without motor, is 2620 pounds.



SELF OILED 22 IN. ALL GEARED DRILL.



UNIVERSAL MACHINE VISE APPLIED TO MILLER.

TRADE AND COMMERCE RECORD

Dealing With the Steps Being Taken and Progress Made by Industrial Canada To Achieve and Maintain a Dominant Place in the Markets of the World

New Fields for Steel Products.

One of the features of the steel trade in Canada during the past year has been the opening up of new fields of business by the Dominion Iron and Steel Co. Until recently its efforts had been centered on manufacturing steel rails, and for this product it found a ready market in the big railway corporations which have been extending their lines at an abnormal rate during the past few years. The building of transcontinental railways cannot, however, go on for ever, and the demand for rails in this country will not always be greater than the supply. There is another important factor in this expansion. Previously, the Steel Company of Canada purchased their rods from the Dominion Iron and Steel Co., and converted them into wire, nails, etc., at their various mills. Early this year, the former concern erected a large rod mill at Hamilton, Ont., and from that point they commenced to manufacture their own product from start to finish. This resulted in the expansion of the Dominion Steel Corporation business referred to above. The product of their rod mill had to go somewhere, and what more natural than that they should invade the field now supplied by the Steel Company of Canada. First, strong efforts were made to secure a hold in Montreal, and secondly, offices and warehouses were leased in Toronto, and wire, nails, and steel bars placed on the Ontario market. So energetically has the business been pushed, that a big trade has been built up, resulting in keen competition. As a result, the price of nails and wire has dropped in a most marked degree. The advent of this company into the Ontario and Montreal markets has meant a loss of business amounting to hundreds of thousands of dollars to other companies manufacturing these lines.

There is another feature of the expansion of the business done by the Dominion Iron and Steel Co. Exportation of wire to New Zealand has been frequent, and now export of nails to Australia has commenced. Last week, the S.S. Cairnross, of the New Zealand line, shipped over 400 tons of nails and wire from Sydney, N.S. for Australian ports. Thus Canada is competing successfully with British and United States steel companies for business in the Antipodes. Both these countries export an enormous quantity of steel products to both Australia and New Zealand.

Talking about trade with Australia, it should not be forgotten that Hon. E. Foster spent much time there this year, endeavoring to develop trade. This is probably why Canadian trade with Australia has grown considerable during the last twelve months. Australia buys six times as much from Canada as Canada buys from Australia, and is buying more every month. Australia bought goods in the United States last year amounting to $10,083,755, and in many cases the articles purchased were just those that Canada has to sell. In view of the policy of Australia to purchase within the Empire, the future for Canadian trade with that country looks rosy.

British Manufacturers in Canada.

Some weeks ago a movement was begun to send an exhibition train from one end of Canada to the other, showing nothing but British-made goods. This resulted from the success of the Made-In-Canada train. The idea caught on at once, but the organizers have struck a snag, bringing out a fact which explains why British manufacturers do not push business in Canada, and why some of those who have entered the field have left it. A Halifax, England, engineering firm was asked to exhibit their goods on this train, and they replied in effect: "We have spent hundreds of pounds to try and find out what prospects there are for business in Canada. In a tour from one end of the Dominion to the other, our representative found that the prospect of business turned simply on the extent of credit we were prepared to give. They found that Canadian and American firms would give up to three years' credit. We had, therefore, to do the same to run a chance of getting a share of the business." What this firm says is substantially correct. The facts are there, and to do business in Canada, British firms must be prepared to give credit. Some of those who have established agencies in this country have disliked this credit so much, they have left the field, declaring that they can find just as good business with quicker returns in the Mother Country. There are others who have realized the situation, have established offices or branch plants here, and are prepared to give the credit, and get the business. Another thing the British manufacturer should know; this is that business is not secured in Canada for the mere asking. They will find keen competition from Canadian and American firms, and to secure the business they must advertise, and then go after it. A typical example of the way business is secured in Canada will be quoted for the benefit of British manufacturers who contemplate coming to Canada. A few weeks ago, the town of Davidson, Sask., required an electric light and power plant, and were willing to spend something under $10,000 for it. Money being rather scarce, they looked for a company that would grant them the most reasonable terms. The offer of an Ontario firm took their fancy. This firm agreed to equip a power plant for the sum of $8,500, and were willing to take $6,500 in the town's debentures. The local newspaper says: "The town council thinks the offer of taking up debentures is exceptionally good, and have sent their superintendent to Q———, to inspect a plant installed there by this firm. After all, of course, everything is subject to the endorsation of the ratepayers, probably some time this month, if there is no further delay."

Larger Shingle Export.

The change made recently in the United States tariff did not affect the machine tool business much in this country, but the indirect effect on the sale of woodworking machinery should be very marked. The tariff change has given a great impetus to the shingle industry, especially in the West, and this will mean the erection of more mills and a demand for more machinery. The duty of fifty cents on Canadian shingles has been entirely removed, with the result that Canadian factories are able to deliver shingles in the United States at a much lower figure than Americans could produce them.

A Motorcycle Plant.

The experience of a company who started out to manufacture motorcycles in Canada and met with difficulties, should be of interest to others starting out on similar ventures. About a year ago, the Brantford Autocycles, Ltd., was organized with a capital of $75,000 to make motorcycles. A blacksmith's shop was secured and equipped with a plentiful supply of first-class machine tools. A mechanic who had had experience in the manufacture of motorcycles was secured from Detroit, and a start made to manufacture four models. It was hoped to have these completed in a short time, and then to build a plant, but the year has been spent in turning out these models. Difficulties were encountered in securing parts from Detroit, and some of the parts made locally did not meet with approval and had to be re-made. A few weeks ago, the first model was tried out on the street, and proved to be a first class machine, powerful, a little heavy, but designed in such a manner as to be easily manipulated. The capital being almost exhausted and the models completed ,the time has arrived when another step must be taken, and now the company are undecided whether to go ahead with the erection of a plant or to have the machine made to order elsewhere.

Smoke Consumers on G.T.R.

The Grand Trunk Railway has been experimenting for some time with smoke consumers for application to locomotives, and has so far met with sufficient success to warrant equipping all the yard locomotives at Windsor, Ont., as well as a few others at different points on the system. The type used is very similar to those in use by railways in Chicago, where an anti-smoke campaign has compelled them to use some device that will materially reduce the smoke. Along the side of the firebox, from 16 to 18 ins. above the fire, there are eight tube openings. On the outside are small steam jets, so placed that the jet at the point of entering the tube creates a strong draught and carries in a volume of air over the top of the fire. The air brought in through these side openings mixes thoroughly with the smoke in the firebox immediately after it is given off from the bed of coals, and, with a bright fire burning, the smoke is almost completely consumed. In a demonstration several shovels of coal were thrown on a bright fire, resulting in dense smoke being given off. Turning on the steam through these side jets reduced the smoke almost instantaneously, so that the vapor given off at the stack was just slightly colored. The results of the experiments have been so successful that it is not at all unlikely the yard locomotives all over the system will be so equipped. The road locomotives may likewise be so equipped, but the advantages accruing are not considered to be as great as in yard locomotives, where the question of smoke in the atmosphere is of considerable importance to the community.

An Interesting Legal Point.

Whether a company can recover the amount stolen from them by an employee, for which he has been sent to jail, is a question which will be settled at Osgoode Hall, Toronto, before long.

The Massey-Harris Company, the well-known Toronto firm of agricultural implement makers, have entered action in the civil courts against James H. Denison, a bookkeeper formerly in their employ, to recover $24,718.20, the amount he admitted having taken from the company's funds, which he lost in betting transactions. In the criminal court he was sentenced to three years' penal servitude.

British Trade Returns.

The following are the official figures of the trade between Canada and Great Britain in the undermentioned articles during October:

From Canada.	**Oct., 1913.**	**Oct., 1912.**
Wheat	£829,432	£897,434
Wheat meal & flour	224,549	196,424
Oats	43,530	111,480
Cattle	—	2,193
Bacon	61,120	88,675
Hams	14,148	10,473
Cheese	587,041	674,864
Canned Salmon ...	74,578	6,437

To Canada.	**Oct., 1913.**	**Oct., 1912.**
Spirits	£ 87,748	£ 96,034
Sugar	1,561	5,102
Wool	11,710	8,942
Pig iron	28,017	66,008
Ship, etc., plates...	15,605	3,163
Galvanized sheets..	36,010	58,913
Steel bars, etc.....	19,667	31,319
Pig lead	20,774	12,993
Unwrought tin	17,686	17,539
Cutlery	10,768	13,885
Hardware	11,461	14,121

An Important Judgment.

Alfred Rogers made a contract with the National Portland Cement Co., of Durham, Ont., to be their sole agent for five years from January 15, 1910. He so organized and advertised the business that his annual net profits were $18,000. When two years had elapsed the Cement Company broke the contract. They were compelled to meet the market price, and decided to offset the loss, in part at least, by reducing their expenses of selling. Mr. Rogers entered action for $54,000, being the amount of his profits for the three years the contract had yet to run. At the trial it was stated for the defence that Mr. Rogers had made use of an expression to the effect that he had terminated or would terminate the contract, but Mr. Justice Lennox, who heard the case, would not accept this evidence, and gave judgment for Rogers. A reference is directed to the Master-in-Ordinary to determine how much of the $54,000 claimed should be paid to Mr. Rogers.

Spruce Consumption for Pulp.

The abundance and cheapness of newspapers and other printed matter is one of the most salient features of our modern life. We take a complacent pride in comparing our one-cent 12-page productions with the insignificant six-penny "Times" of a hundred years ago. We seldom give it a thought that all this wealth of morning and evening editions, sporting extras, magazine sections and comic supplements is making a tremendous drain on our forests of spruce. One large daily paper in New York consumes in the course of a year as much spruce as can be cut from four to five thousand acres. If the proprietors of this newspaper maintained a forest, sufficiently large for the annual growth to supply them with all the pulp necessary for a year's consumption of paper, they would require a tract about 14 miles square.

The demand for spruce is not only large but rapidly increasing. In the United States, the cut of 1909 was double that of 1899 and six times that of 1889. It is not surprising, therefore, to learn that Mr. Pinchot has estimated that there is only from 10 to 30 years' cut in sight in the various States. Already, the production of pulpwood south of the border seems to have reached a maximum, having decreased from 1,786,000 cords in 1906 to 1,474,000 cords in 1910. This decreasing supply, operating in conjunction with the increasing demand, has led to a great augmentation in the imports from Canada.

At the present time, pulpwood is made almost entirely from spruce and principally by the mechanical process. In Canada, in 1912, the aggregate of wood used was 866,042 cords, and of this 677,747 cords were spruce. The aggregate of pulp manufactured was 682,632 tons, of which amount 499,226 tons were made mechanically. These figures represent an increase of about 44 per cent. over 1910. Canada has by no means yet reached the limit of her production, but it can only be a question of time till the operation of the same forces brings about the same situation as in the United States.

In the circumstances, the question of finding substitutes for spruce becomes of peculiar interest and it is interesting to learn that, assisted by a grant of $30,000 from Congress, experiments are now being carried on in Wisconsin with a view to testing the efficacy of such woods as hemlock and jackpine as substitutes for spruce in the manufacture of paper-pulp. With regard to jackpine, it may be said that if it could be utilized in the making of paper, we might turn to profitable account a tree which, at present, has very little commercial value.

ALL FOR THE BEST.

WHEN trouble of one kind or another overtakes us as individuals, no matter how distressing its effects, or when disaster stupendous in its scope and dire in its results shakes from the foundation communities or even nations, those of us, who have on the particular occasion evaded the onslaught, are prone to give expression to the consolatory phrase—"It is no doubt all for the best." We have, from a date unplaced, because away back in our memory, become so accustomed to hear about if not to experience more or less trouble and disaster, and have imbibed and been trained towards the cultivation of a spirit of resignation to the will of a Supreme Being, that much of the purpose and aim of the varied lesser or greater calamities which beset our being passes unnoticed, and therefore unheeded. A well known modern writer recently wrote that "the streak of truth in **All for the Best** was rather a curious one," and goes on to say that people are still talking education, by which sensible people mean learning something, and silly people mean learning anything.

At no previous period in the world's history has the craze for education been so rampant, and, correspondingly, there never has been a time, in spite of the efforts put forth and the means and facilities provided, when we learned less of what is after all really of personal individual importance. In the endeavor to achieve greater accomplishment, through the mediums of commercial and technical education, it is abundantly evident that we are learning much that is superfluous, if not actually dangerous and contributory to future disaster. Too little heed is paid to the fact that it is necessary to unlearn much, and that the process involved is as much and perhaps more educative than the other feature, and far more effective in off-setting trouble and accident.

In spite of the widespread disposition to consider some material creation in mechanical or marine engineering, in transportation or other direction, as the "last word" in its particular sphere, it needs be brought home to us that we are wrong oftentimes, hence the necessity for troubles, accidents, calamities and disasters. No one will deny but that we are getting the latter, and the most impressive part about the thing is that, unconsciously, by our very attitude and action, we are inviting them.

By our acquiescence and resignation in accepting trouble as being "All for the Best," we do well, but unless we take such steps as will not only prevent repetition of some particular happening, and at the same time rid our heads of the thousand silly notions which there find a lodgment and sift well the conglomerate mass which we daily import, there is little else than mockery in the "All for the Best" attitude displayed.

The imparting of knowledge, as education is generally meant to imply, is a process that all from the youngest to the oldest of us find hard to make effective, yet, we believe, hard as that may be, it is harder still to educate ourselves by unlearning or getting rid of what is harmful. All of us have ideas in our heads, however, proud of them we may be, that have no more right there than has a bullet, and until such foreign matter is removed, further imparted education, however valuable will mix badly.

The recent shipping disaster on our Great Lakes was "All for the Best," we say, yet notice the attitude taken by those interested and others who dearly love airing their views in the daily press. Column upon column has been written on the why and wherefore of the tragedy, and most ludicious of all that have appeared are the attempts that have been made to show that as far as the steamship companies are concerned, their property was in no way contributory.

So far as this recent Lakes disaster is concerned, all has been for the best, and it only remains for those concerned, as distinct from those affected by the loss of relatives, to come off their perch, take their medicine like men, get rid of or unlearn what they have formerly considered perfect knowledge of naval architecture and marine engineering, and proceed to work so that such an occurrence or anything similar will be a remote possibility.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON.

	Mont'l.	Tor'to.

The General Market Conditions and Tendencies

This section sets forth the views and observations of men qualified to judge the outlook and with whom we are in close touch through provincial correspondents.

Montreal, December 1, 1913.—There is little change in general business conditions since last week; however, collections are improving locally and the feeling that each week brings the end of the depression a little nearer serves to keep up one's spirits. The greatest crop on record has been safely harvested and the proceeds are just beginning to flow a little freely. Business, generally, is still restricted to transactions in immediate needs, a condition of affairs that will no doubt continue until a recovery of the money market takes place. No material release of funds need probably be looked for until next spring and in some lines of business conditions may become worse before then. However, a business depression usually provides its own cure, since by restricting operations it decreases the demand for funds.

The local machinery market continues very dull, a few scattered orders being all that have materialized during the past few weeks. Dealers are all busy on tenders for the equipment wanted by the Grand Trunk Pacific at Prince Rupert, B.C. These have to be in by December 15. It is to be hoped that Canadian houses will secure the bulk of this important order, though there seems to be an opinion prevalent that most of it will be placed in New York.

Most foundries report plenty of orders on hand for immediate delivery, but not a great deal of work ahead. It is stated that the pig iron stocks of most consumers are low, but there is still a strong disposition to buy cautiously, there being a very general feeling that prices may shortly drop. Merchants are inclined to think that a slight lowering of prices would stimulate a really brisk buying demand and that prices would then advance again. The furnaces at Hamilton, Deseronto, and Port Colborne are all busy, the last named being said to have orders on hand for four months ahead. The Dominion Iron and Steel Co. is selling a little pig, but uses the bulk of its product is for its own use.

Copper remains firm at last week's figures, its rapid fall having apparently been stemmed for the present. Lead is considerably easier in view of the larger supplies now in sight.

◆

Toronto, Ont., Dec. 2.—While makers of steel are inclined to view the business situation pessimistically, there is a little brightness on the horizon. With all the rumors circulating about steel plants laying off men and some closing down, it is cheering to learn that the Swansea plant of the Steel Company of Canada, which has been working four days a week, will shortly go back to full time. This plant manufactures bolts, nuts and screws, and it is a bigger demand for bolts that has improved the prospects.

There is another fact that gives cause for optimism. In Western Ontario, manufacturers are holding out for lower steel prices, but their stocks are so low, that they will soon be compelled to buy. Like the man trying to sell his shares when the stock market is the most favorable, he may not hit it at the right place. He may find that he has waited too long, and that the price of steel has advanced. There was a report in the city this week that the price of steel bars in Pittsburgh had advanced 5 cents a cwt., but this could not be corroborated locally.

Stronger Market.

The steel market is decidedly stronger this week. Efforts are being made to hold it up, and the feeling all round is that the price has gone as low as it can. Buyers demand a lower quotation, but usually give the price asked. Prices have remained firm here for the past three weeks, but there is a likelihood of a further drop where the steel companies are desirous of keeping their men.

A Montreal newspaper published a report last week to the effect that the Steel Company of Canada was contemplating new financing. This was denied by a prominent Hamilton official, who stated that the company had plenty of money to keep them going. The United States Steel Co. are reported, on excellent authority, to have prepared plans for their Sandwich plant, and intend to go ahead and build.

Wire and Nails.

The wire and nail business is picking up, although prices are poor. Orders are coming in faster. The price of nails is 2.25 cents, against 2.50 cents formerly. Wire is 2.20 cents base, and there is lots of business at that price.

Tool steel for drills on the new Welland Canal will probably not be required until next summer, as it is hardly likely that contractors will be operating their rock drills by the spring. Conditions on different sections vary, however.

Machine Tools.

Big shops, like the implement makers, electrical and locomotive firms, are badly in need of machine tools, but apparently are holding off until things improve. The machine tool agents feel the loss of this business keenly. The railways are all sending in good inquiries, and small machine shops are buying tools, but for which, the machine tool business would certainly be slack. A big locomotive works report that they are not buying tools until the first of the year.

Inquiries this week include one from the Michigan Central Railway for their St. Thomas shops. They require two shapers, 16 in. and 24 in., an 18 in. lathe, four 16 in. lathes, a 30 in. lathe, a 600-ton hydraulic wheel press, a 100-ton ditto, motor-driven grindstone frame, 25 or 30-ton forcing press, high speed hack saw, 3 ft. and 4 ft. radial drills, motor-driven emery grinders, and other tools. Tenders are to be in early. B. Aikens, purchasing agent, Detroit.

N.T.R. Inquiries.

The Transcontinental Railway have invited tenders for the following: tap lathe, drilling machine, shaper , pipe threading machine, bolt cutter, motor-driven grindstone frame, motor-driven grinding machine, and an up draft forge, all for Grant, Ont.

The Kelsey Wheel Co., of Windsor, Ont., have not yet purchased their machine tools. The Sarnia Bridge Co. are buying a large crane. The Ontario Steel Products Co., Gananoque, should be replacing some of the tools damaged in the recent fire.

The Russell Motor Co., Toronto, have reached a point where they must go ahead with the manufacture of 1914 season cars, and propose to take on hands at the rate of fifty at a time, until by the spring their staff is increased by 200. As they recently laid off a lot of men, these will no doubt be taken on again. They will not be buying new equipment.

Metals.

People who have scrap seem more inclined to sell now, having got the impression that the market will not improve at the moment. Big dealers are buying all they can lay hands on at the present price. There are, however, few sales of metal, and prices remain the same practically. Orders for scrap iron and steel are not being placed by big steel companies.

◆

St. John, N.B., Nov. 29, 1913.—The Atlantic Oilfields, Ltd., has been incorporated at Fredericton with a capital of $3,000,000, with its head office there, for the purpose of developing the oil-shale deposits of New Brunswick. The incorporators have the right to locate, quarry, mine or bore for oil, oil-shale, albertite, and other substances, and to operate wherever necessary in this connection. Old Country money is behind the venture. The incorporators are J. Fraser Winslow, J. B. Gregory, A. E. Rush, A. L. Finnamore, all of Fredericton.

Secretary Hoag, of the Board of Trade, announced this week that a new brick plant would probably be established at St. John early next spring. The price of bricks here this summer has been unusually high, and the local concern engaged in their manufacture has been unable to cope with the demand, so much so, in fact, that contracts for a millon or more were given to the Nova Scotia Clay Co. at Annapolis, in order to meet the requirements of the Atlantic Sugar Refinery Co. here. It is now said definitely that local people intend erecting a brick manufacturing plant here, on a site already taken, in the spring.

A Company, composed of F. Cooper, F. B. Edgecombe, B. Adams, and K. Kein, of Fredericton; H. J. Gordon and W. H. McWhinney, of Black River, has been formed to develop valuable copper deposits at Black River, N.B. Copper mining on an extensive scale will be carried on by them. From various places reports have been received of the analysis of the ore deposits, and they show $15 to the ton of copper, and $4 to the ton gold. The discovery of the deposits was made by A. C. Gordon, an experienced miner of Montana, on the property of R. Moore.

The new shoe factory at St. Stephen is practically completed, and Messrs. Clarke, managers of the plant, have strong hopes of a number of machines being in operation by the first of the year. This new plant means much to the industrial life of St. Stephen.

The Rothwell Coal Co. have installed a plant for mining by machinery in their mine at Minto, and an expert from the manufacturers is to go there to test the operation of it. The new machines will add greatly to the output, as each machine takes the place of six men, who will all be employed on other work in the mine.

Trade Gossip

The Goodyear Tire & Rubber Co. of Canada, Ltd., has just announced several important changes in the personnel of those at the head of its sales organization. P. D. Saylor, vice-president and sales manager of the Canadian Company, has been made president and managing director of the Goodyear Tire & Rubber Co. (Great Britain) Ltd., with headquarters in London, Eng. R. P. D. Graham, secretary and manager of the Automobile Tire Department, has been elevated to the position of sales director, succeeding Mr. Saylor. H. C. Lower, for some years assistant manager of the automobile tire department of the Goodyear Tire & Rubber Co., of Akron, Ohio, succeeds Mr. Graham as manager of the tire department. The announcement of Mr. Saylor's transfer across the Atlantic has been received with regret by Canadian automobile and tire men generally, in whose esteem he won a high place. The record he has made, however, justifies their belief in his ability to handle the vast problems which now confront him. As head of the Goodyear Tire and Rubber Co. (Great Britain) Ltd., he will have direct charge of the extension of Goodyear interests throughout the world, outside North and South America. Upon laying down the reins of office here, Mr. Saylor was presented with a magnificent diamond ring by the members of the Goodyear sales force. He carries with him into his new field of labor the sincere good wishes of the whole Goodyear organization as well as of a host of personal friends.

P. D. SAYLOR.

The Jackson Manufacturing Co., Clinton, Ont., have formed a joint stock company with an authorized capital of $150,000. The officers of the company are W. Jackson, president; T. Jackson jr., vice president, treasurer, Miss Josie Witts and secretary, Miss Ida Wilkin. The company have made the head office at Clinton, and branches of their factory, are at Goderich, Exeter and Zurich.

The Canadian H. W. Johns-Manville Co., Ltd., have removed their Toronto branch to more spacious quarters at 19 Front Street, East. This new store and warehouse has a floor area of approximately 35,000 sq. feet, and is situated in the heart of the wholesale district. They will carry a larger stock, and have ample space for the display of their J-M Asbestos Roofings, packings, pipe coverings, building materials, electrical and railroad supplies, automobile and plumbing specialties, etc. The entire building will be lighted by their Frink and J-M Linolite system of lighting, and one room will be used for exhibiting these systems.

The Canadian Fairbanks Morse Co. have just completed a large and modern warehouse and office building, at Montreal, situated on St. Antoine Street, not far from the C.P.R. offices. This building is of concrete construction throughout, and thoroughly up to date in every respect. Instead of the usual sample room floor and offices entirely separate, it is the company's intention to have two main sample room floors with offices combined, so that customers can see the goods they are intending to purchase at the same time as they are discussing them with the various departments. There will be a demonstrating room in the basement, so arranged that gasoline engines, motors, etc., can be seen in operation from the street. Among other novel features will be a customers' waiting room, and an internal water filtration plant.

INDUSTRIAL AND CONSTRUCTION NEWS

Establishment or Enlargement of Factories, Mills, Power Plants, Etc.; Construction of Railways, Bridges, Etc.; Municipal Undertakings; Mining News.

Engineering

Castor, Alta.—L. G. Humbert, of Consort, is contemplating the erection here of an iron works.

Victoria, B.C.—The Canadian Steel Studding & Mfg. Co. has been incorporated here.

Hamilton, Ont.—The Osler File Co., who do file recutting and rasping, will double their capacity in the near future.

New Glasgow, N.S.—The Eastern Car Co. is running its plant at full capacity on an order for 2,000 cars secured a year ago.

Tillsonburg, Ont. — The Tillsonburg Car Co. have secured sufficient orders to assure the operation of the plant all winter.

Toronto, Ont.—R. J. Selby, 484 St. Clarens Avenue, has started to manufacture wood and metal patterns and models.

Port Arthur, Ont.—The Miles Car and Manufacturing Co., Cleveland, Ohio, may establish a plant at either Port Arthur or Fort William.

Vancouver, B.C. — In a fire which broke out on Nov. 28, the Canadian Westinghouse Co., suffered damage to the extent of $75,000.

Halifax, N.S.—The Nova Scotia Car Works, Ltd. is overhauling its plant, and rebuilding the foundry which was destroyed by fire last summer.

Dundas, Ont. — The John Bertram & Sons Co., Ltd., will extend their pattern storage building. Other local firms are contemplating extensions.

Edmonton, Alta.—Fire in the McKinney block did $200,000 damage November 25, of which $10,000 was sustained by the Otis-Fensom Elevator Co.

St. John's, Nfld.—The Reid-Newfoundland Co. are very busy just now. Several competent Canadian engineers and machinists have recently been taken on.

Vancouver, B.C.—Letson & Burpee, Ltd., die makers, machinists, etc., 142 Alexander Street, are not yet prepared to go on with the erection of a new plant.

St. John, N.B.—Garnet Wilson, 50 Princess Street, has been appointed architect for a nail and wire fence factory for a syndicate. Plans are being made.

Orillia, Ont.—An English motor car firm, who expect to make 2,000 cars next year, are negotiating with the Council for a site opposite the Tudhope-Anderson factory.

Galt, Ont.—The Galt Garage and Repair Co. will erect a new shop, single storey, 50 x 75 ft. George McGavin, late of Canadian Motors, Ltd., will be manager.

Hamilton, Ont.—The Brown, Boggs Co., Ltd., have built a new foundry, and converted their old one into a machine shop extension. Early next year they should be in the market for moulding machines, etc.

Montreal, Que.—Work that should have been done at the Port Huron, Mich., shops of the G.T.R., which were burned last week, will be performed in Canadian shops.

Toronto, Ont.—The Canada Wire & Cable Co. have built a new plant at Leaside, and have bought four Robb-Mumford boilers of 60 in. diam. x 18 ft. long, 130 h.p., 125 lbs. pressure.

New Westminster, B.C.—The council have extended the time limit for the completion of the plant of the Heaps Engineering Co., Ltd., by a year. It should have been completed December 1.

Montreal, Que.—The plant of the Canadian Rolling Mills, which is connected with the Canadian Tube and Iron Co., is nearing completion, and should be ready for operation by February.

London, Ont.—The Grobb Co., capitalized at $100,000, will erect an addition to the London Foundry for the manufacture of forgings and gas producers. They ask the city to loan them $25,000.

Welland, Ont. — The Mentholateum Co., Ltd., have finished their $22,000 plant. The Mesta Manufacturing Co., of Pittsburgh, will have some of their product for Canadian trade made in this plant.

Sydney, N.S.—The Dominion Coal Co. will shortly commence operating their

MACHINERY EQUIPMENT, TORONTO TECHNICAL SCHOOL

Machine tools, woodworking machinery, and foundry equipment costing between $20,000 and $30,000 will be required by Toronto Technical School early in the new year. The new school on Harbord Street, is nearing completion, and when contracts for the new equipment have been let, delivery must be prompt. The equipment for the machine shop will consist of drills, grinders, one or two planers, two shapers, three or four milling machines, engine lathes of various makes and styles, and smaller machine tools. The woodworking tools will include a jointer, circular and band saws, surface planer, sandpapering machine, universal trimmer, etc. A blower and motor will probably be required for the forge as well as the regular equipment. In the foundry there will be a small cupola, brass furnaces, a sand blasting arrangement, air hoist and hand traveling crane, and probably two moulding machines. Besides these, equipment will be required for an electrical construction shop, for a plumbing shop, and equipment for making brick and cement work. Many of the machine tools must be self-contained, motor-driven. Tenders will be called for by J. W. McBean, who has charge of the lay-out of the various departments, and who will visit several large machine shops in Ontario before deciding on the type of equipment to be purchased.

new bank head screening plant and trestle which has just been completed by the Sydney Foundry and Machine Works, Ltd., at No. 16 colliery, New Waterford.

Victoria, B.C.—The Esquimault and Nanaimo Railway Co. will move their machine shops from Wellington to Victoria, B.C., early next year. They will employ 50 men. H. E. Beasley, general superintendent.

Brantford, Ont.—The plant of the Farmers' Binder Twine Co. has been sold to a syndicate composed of A. L. McPherson and others. It will be occupied by the Brantford Scale Co. or the Brantford Grey Iron Co.

Vegreville, Alta.—Garneau Bros. & Inkster are installing machinery for a machine and general repair shop in connection with the garage on the north side. The shop will be in readiness to handle work about December 1.

Ottawa, Ont.—The Ross Rifle Co., Que, is stated to be planning the erection of a factory near the Connaught rifle range, Ottawa, This Company manufactures much of the ammunition and rifles used by Canadian troops.

Hamilton, Ont.—The Chadwick Brass Co. extension has been delayed until next spring. It will be three storeys, fireproof construction, and include machine shops, plating shops, etc. The Company make brass gas and electric fittings. W. M. Currie, vice-president.

Galt, Ont.—Notice was given the employes of the Machinery Co. (Ballantyne's foundry), that the shop would close down for an indefinite period at noon, last Saturday. The apprentices will be supplied with work elsewhere to fill out their term.

Windsor, Ont.—Cass and Lloyd, formerly of Vancouver, are negotiating with a view to purchasing a portion of the old malleable iron foundry, on Walker road. If successful, it is their intention to make necessary alterations and rent space to manufacturers.

Vancouver, B.C.—The Morrison Nail & Wire Co. has obtained a new site on Lulu Island on the North Arm of the Fraser, and contemplate removing its Vancouver and Westminster works to this location. The site is of 16 acres, and has a waterfrontage of 600 feet.

Sault Ste. Marie.—The Algoma Steel Corporation is completing plans for two new open hearth furnaces. They will be ready for operation next summer. This will add 300 tons a day to the present 600 tons open hearth capacity. The work will cost $250,000. President, J. Frater Taylor.

Toronto, Ont.—A building permit was issued by the city architect's department, November 27, to the United Typewriter Co., for the erection of a six-storey brick warehouse on the east side of Victoria, near Queen Street. The new building will cost $55,000.

Stratford, Ont.—The G.T.R. will make extensions to its Stratford property. Plans are under way for the extension of the round house, adding about twenty more stalls, which will double its capacity. It is not expected that this work will be commenced until next spring.

Goderich, Ont.—A by-law granting the American Road Machine Co. fixed assessment of $10,000 and guaranteed bonds of $40,000 was passed last Saturday. The new plant will be constructed of concrete and steel, 400 feet by 70 by 30, costing over $67,000, with machinery worth $30,000.

Fredericton, N.B.—The following firms have been licensed to transact business in New Brunswick during 1914:—McLaughlin Carriage Co., Ottawa; the Petrie Mfg. Co., Hamilton, Ont.; Canadian Fairbanks-Morse Co., Montreal; Siemens Co., of Canada, Ltd., Montreal; John Taylor & Co., Ltd., Toronto; Sharples Separator Co., of West Chester, Me., and the Page Wire Fence Co., of Walkerville.

Hamilton, Ont.—The plant of the Canada Steel Co., which was burned in August, is practically rebuilt. The old rolling mill is in operation, and new mills are being installed for manufacturing channels, small T bars, angles, rounds and squares. The motor for running this has been ordered. The machine shop has been newly equipped. More tools will be required later, including 24 in. shaper, planer, grinders, etc.

Westmount, Que.— Westmount Motors, Ltd., has been incorporated at Ottawa, capital $50,000, to manufacture and repair automobiles, motors, boats, etc., and to carry on the business of machinists, blacksmiths and foundrymen. Incorporators: William K. Mc Keown, Leopold Choquette, advocates; Edward A. Barnard, James R. Law and George E. Chart, accountants, Montreal, Que.

Montreal, Que.—The White Smelting and Refining Works, Ltd., has been incorporated in the Province of Quebec to treat ores and to carry on a general foundry and machine shop business at Montreal, with a capital of $20,000. They will acquire and pay in cash for the business owned by A. Rudolph Vallance and Emile Schwartz. Among those interested are, J. Washington Richards and J. A. T. Richards, Montreal.

Levis, Que.—The National Drop Forge Co., Ltd., has been incorporated at Ottawa, capital $49,000, to carry on in all its branches the business of drop forging in general and manufacturing saws or any other business of a like nature. Incorporators: John B. Dorais, manager, Eusebe Belleau and Noel Belleau, lawyers, of Levis, Que., Elzear Baillargeon, lawyer, and Ulderic Saindon, accountant of the City of Quebec.

Gananoque, Ont.—The Ontario Steel Products Co., Ltd., whose spring and axle plant was burned down last summer, are building a larger plant of brick, stone and reinforced concrete, with steel sash, and steel trusses covered with Johns-Manville patent roofing. It is equipped throughout with Chapman ball bearings, and will be in operation Dec. 15. The old equipment is being cleaned up and re-built, but some will be found useless. This will be replaced by new equipment in due course.

Electrical

Ayr, Ont.—The Hydro-Electric will supply this town with power, and probably New Dundee and Roseville as well.

Perth, Ont.—James & Reid will instal an electric lighting plant in their large hardware store and manufacturing plant.

South Vancouver, B.C.—The town will instal fifty fire alarm boxes at a cost of $13,000 and 25 police telephone boxes at at cost of $10,000.

Fort William, Ont.—The Maynard Electric Co. of Winnipeg, is planning the erection of a large warehouse here, where it does a large business.

Forrest, Ont.—The by-law to issue debentures for $7,500 to complete the electric light plant has passed committee stage.

Neepawa, Man.—A by-law authorizing the expenditure of $18,000 on improvements to the electric light plant will shortly be submitted to the ratepayers.

Sandwich, Ont.—The ratepayers will vote in January on two by-laws, one to take Hydro-Electric power, and the other to provide money for installing the system.

Courtright, Ont.— The Western Salt Co. proposes to light the streets by electricity. J W. James offers to instal a gasoline engine and generator if given franchise. There are other offers.

Ottawa, Ont.—Mayor Ellis and the Ottawa Electric Commission, with Hon. Adam Beck, went over the details of a new contract with the Ottawa and Hull Electric Co. last Thursday. The increased power consumption has made a new agreement necessary.

St. Thomas, Ont.—The street car system was put out of business last Thursday when the rotary converter broke down. City Electrician Roberts recommends the city to purchase another at a cost of $2,300.

Hamilton, Ont.—The Hydro-Electric Commission have decided to supply power to the Township of Barton. Hamilton has been asked to construct the plant and supply the power, but the commission may do it.

Dryden, Ont.—The bondholders of the Dryden Timber & Power Co. have sanctioned an issue of notes for installing additional machinery. About $100,000 will be spent. The mills will be closed down for two or three months.

Brantford, Ont.—The Western Counties Electric Co. have engaged experts to secure long-time contracts with manufacturers and other big users of power, thus fighting the Hydro-Electric Commission, who will shortly enter the city.

Vancouver, B.C.—A fire broke out in the warerooms of Hetson & Gillis, electrical engineers on November 28. The losses total $155,000, as follows:—Canadian Westinghouse, $75,000; McGowan & Co., $20,000; Montelus Piano Co., $20,000; W. J. Haddock, $25,000; Hetson & Gillis, $15,000.

Orillia, Ont. — The Hydro-Electric Commission of Ontario have made an offer to supply power to the town. The commission is prepared to pay the town $100,000 for its power plant, etc. In the meantime the Water, Power and Light Commission will not go ahead with the erection of a power plant at Swift Rapids.

Peterborough, Ont.—The Government has cancelled the lease given by the late Government to Mr. Culverwell and others of the Burleigh power. The lease was given originally for one dollar per year for fifty years and entitled the lessee to all the surplus water which was to be handled by the Government in the lessee's interests. This power will probably be developed for the people.

General Industrial

Calgary, Alta.—Snow & Baker, of Whitefield, N.H., will erect an overall factory here.

Calgary, Alta.—The Western Milling Company will build a 1,200 bbl. plant to cost $200,000, to be in operation by July next.

St. Mary's, Ont.—G. Garter, Sons & Co., Ltd., have completed plans to build a 700-bbl. flour mill.

Lethbridge, Alta. — The Columbia Macaroni Co. have installed their machinery and will start operation early this month.

Caledonia, Ont.—A company in which W. W. Huchinson is interested will build a gypsum mill, plans for which are being made.

Carmen, Man.—The Canadian Tile and Fire Proofing Co. will increase their plant during the winter. New kilns will be added.

St. Catharines, Ont.—Carpenter work has begun on the new plant of the Dominion Foods Co. This will be a two-storey building.

Cobourg, Ont.—The Cobourg Drying Co. have purchased a building in which they will instal machinery for a drying plant. J. E. Hall, Supt.

Arnprior, Ont.—A manufacturing concern will erect a factory here, and the town will lend them $10,000. A large exporter will erect a grist mill here.

Lucan, Ont.—The Lucan Evaporator, owned and operated by J. F. Langdon, of Brighton, Ont., with over $4,000 worth of stock, was totally destroyed by fire, Nov. 27.

Waterloo, Ont.—Snyder Bros. Upholstering Co., are extending their plant 80 x 100 feet, two storeys, at a cost of $15,000. Ellert Bros., are contractors for the mason work.

Deloraine, Man.—A. B. Harris closed down his shoe factory here last week, and is understood to have sold the plant to a Brandon firm who will establish a branch at Regina.

Quebec, Que.—The city council have granted exemption of taxes for ten years to G. A. Vandry, who will commence a biscuit factory here. The machinery has been purchased in France.

Perth, Ont.—J. A. Stewart and W. E. Danner have purchased the shares of Koch and Campbell, Philadelphia, in the Henry K. Wampole Co., and will make extensions to the plant.

Vancouver, B.C.—The Royal Crown Soaps, Ltd., will build a new plant on Burrard Inlet in North Burnaby, costing $250,000. Seven acres have been purchased. F. T. Schooley, local manager.

Leamington, Ont.—The H. J. Heinz Co., makers of pickles, have commenced the erection of a large addition to their plant here. The brick structure will be 80x200 feet, three stories high. The company also intends making alterations in the main building.

Brampton, Ont.—A. Dick & Son, Alton, contemplate starting a knitting factory. Six machines will be installed at once, the number to be added to. The managers think there is room for expansion in the knitting business and will discontinue the manufacture of sleighs, but continue to make wagons.

Wood-Working

Toronto, Ont.—Osler Wade, assignee, will receive tenders for the assets of The T. Heal Woodworking Co., consisting of machinery, stock in trade, etc.

Spuzzom, B.C.—A sawmill, etc., is contemplated by J. C. Shields, Winch Bldg., Vancouver. Besides a sawmill, a flume will be built from the limit to the C. P. R. and a planing mill where the flume meets the C.P.R

New Westminster, B.C.—The plant of the Dominion Match Co. will probably be started at an early date. At a meeting of the shareholders on Saturday, November 29, arrangements were made to put the company on a satisfactory basis.

New Incorporations

Beach Furniture, Ltd., incorporated at Toronto, capital $99,900, to manufacture furniture at Cornwall, Ont. Incorporators: Robert H. Perry, James Freeman, etc., Cornwall.

The City Garage Co., of North Bay, Ltd., incorporated at Toronto, capital $40,000, to operate at North Bay, Ont. Incorporators: David J. Elliott, Daniel E. Shields, etc., North Bay.

Trent Valley Canners, Ltd., incorporated at Toronto, capital $1,000,000, to carry on business as canners, at Trenton, Ont.; Incorporators: Bert H. L. Symnes, George W. Morley, etc., Toronto.

Canadian Contracting Co., Ltd., incorporated at Ottawa, capital $1,000,000, to carry on the business of contracting at Ottawa. Incorporators: Eusebe Belleau, Noel Belleau, etc., Quebec, Que.

The Century Pressed Brick & Tile Co., Ltd., incorporated at Toronto, capital $250,000, to manufacture brick, etc., at Georgetown, Ont. Incorporators: John W. Ramshaw, John R. Peacock, etc., Milton, Ont.

Inland Pulp & Paper Co., Ltd., incorporated at Toronto, capital $200,000, to take over the business now carried on at Thorold, Ont., under the name of Colonial Wood Products, Ltd. Incorporators: Gabriel H. Levy, Archibald H. Gibson, etc., Hamilton.

Electrical Properties, Ltd., incorporated at Ottawa, capital $1,000,000, to organize or to assist in the organization of any corporation, company, etc., at Montreal. Incorporators: Charles A. Pope, Gregor Barclay, etc., Montreal.

McNaughton-McKay Electric Co., Ltd., incorporated at Toronto, capital $40,000, to manufacture electrical supplies and materials of every description, at Windsor, Ont. Incorporators; Arch. McKay, John R. McNaughton, etc., Detroit, Mich.

Lachine Rapids Power Co., Ltd., incorporated at Ottawa, capital $500,000, to carry on the business of an electric light, heat and power company in all its branches, at Montreal. Incorporators: William K. McKeown, Leopold Choquette, etc., Montreal.

Alberta Hydro-Electric Co., Ltd., incorporated at Ottawa, capital $1,000,000, to use and apply water and water power for any of the purposes for which same may be used, at Calgary, Alta. Incorporators: Frederick Stanley, Albright Smith, etc., Calgary.

Alberta Hydro-Electric Co., Ltd., incorporated at Ottawa, capital $1,000,000, to use and supply water and water power for any of the purposes for which the same may be used, at Calgary, Alta. Incorporators: Frederick S. Albright, Arthur L. Smith, etc., Calgary.

Ontario Furniture Co., incorporated at Toronto, capital $50,000, to take over the assets, including the goodwill of the business now being carried on by Keene Bros., at London, Ont. Incorporators: Charles E. Keene, Arthur H. Keene, etc., London.

Electrical Properties, Ltd., incorporated at Ottawa, capital $1,000,000, to organize or otherwise deal with electricity for any purpose for which same may be used, or the manufacturing or dealing with electrical machinery or apparatus of any kind, at Montreal. Incorporators: Charles A. Pope, Andrew A. Wanklyn, etc., Montreal.

Tenders

Vancouver, B.C.—Tenders for the construction of the new immigration shed and office buildings are to be called immediately. The price is estimated at $350,000.

Toronto, Ont.—Tenders for pumps at the high level pumping station, and for the construction of the Gerrard Street bridge have been received, and referred to Works Commissioner Harris.

Toronto, Ont.—Tenders will be received up to January 20, for the installation of a complete mechanical filtration plant, boilers, steam turbo, generator plant, and all appurtenances at Toronto Island.

Bowness, Alta.—The following electrical machinery is required by the Bowness Improvement Co.: One 200 kw. traction motor; one 4-panel switchboard; one 250 kv.a. generator; one gas engine. Tenders will be received until December 31st.

Toronto, Ont.—Tenders will be received, addressed to the Chairman of the Board of Control, up to December 16, for an overhead hand-operated travelling crane, having a working load of 40,000 pounds, for Main Pumping Station, foot of John Street. Chairman Board of Control.

Neepawa, Man.—Tenders were recently opened for machinery for the electric light plant. The placing of orders for two boilers and one engine was left in the hands of W. E. Skinner, to decide between Messrs. Goldie, McCulloch Co., Galt, and E. Leonard & Sons. The order for a generator went to the Canadian General Electric Co. at $2,742.

Refrigeration

Berlin, Ont.—The local medical officer of health strongly urges the city to erect an abattoir here.

Lethbridge, Alta. — Delaney's, Ltd., have bought a site on which they will erect a packing plant.

Hamilton, Ont.—The question of establishing a civic abattoir will come before the council next year.

Moose Jaw, Sask.—The damage to Gordon, Ironside and Fares' abattoir by fire Sunday, November 23, was $145,000.

Moose Jaw, Sask.—Fire on November 22 did much damage to the cold storage plant at Gordon, Ironside & Fair's abattoir.

Burlington, Ont. — The Burlington Skating Rink Co. have applied for a charter, with a capital of $10,000. The Preston Metal Sheeting and Roofing Co. will erect the building. Edward Dickenson and John C. Smith are interested.

New Westminster, B. C.—The Columbia Cold Storage Co. have refused offers made by the city, and will move their plant later to Prince Rupert. They have also awarded a contract for a plant at Steveston, B.C., to the B.C. Granetoid Co. for about $100,000.

New Glasgow, N.S.—John T. Nickerson, Liverpool, N.S., will erect a cold storage warehouse some time early in the new year.

Contracts Awarded

Ottawa, Ont.—The waterworks committee have accepted the tender of the McDougall Co., Ottawa, for fifty fire hydrants. The tender was $2,059.50.

Ottawa, Ont.—The Government has awarded the contract for the ocean section of the terminal scheme to Foley Brothers, Welch, Stewart and Fauquier for $5,208,743.

Victoria, B.C.—A contract for the construction of a dump scow with capacity of 260 cubic yards, has been awarded to the Wallace Shipyards, Ltd., for $8,475.

Halifax, N.S.—The Standard Construction Co., of Halifax, have been awarded the contract for building the new Lennox Passage bridge in Richmond County, Cape Breton.

Nelson, N.B.—K. A. Morrison, Ottawa, Ont., has been awarded a contract for work on the division of line between Nelson and Derby Junction, 2¾ miles, for the Intercolonial Railway.

Ottawa, Ont.—A contract was let last week to the Hall Switch and Signal Co. for the installation of a telephone train-despatching line between Moncton and St. John, on the I.C.R., to cost $10,371.

Waterloo, Ont.—The contract for supplying a turbine pump and electric motor, with capacity of 400,000 gallons, has been given to the Canadian Allis Chalmers Co., Ltd., Toronto, by the Water and Light Commission.

Ottawa, Ont.—The Canadian Bridge Company has been awarded contracts for four bridges on the Eastern part of the Transcontinental. The price is $90,469. The Maritime Dredging Co. will construct a breakwater at Mace Bay, N.B., for $11,823.

Toronto, Ont.—The contract has been awarded by the Board of Control for the supply, and installation of an 84-inch steel conduit to be run across the island from the pure water reservoir to the south tunnel shaft, to the firm, Roger Miller & Sons. The contract price is $540,000.

Victoria, B.C.—The contract for the construction of the reinforced concrete flow line for the Sooke Lake water works system has been let to the Pacific Lock Joint Pipe Co. The company's bid was $329,760 for a forty-inch pipe line, but the size of the pipe has since been increased to forty-two inches.

Municipal

Sudbury, Ont.—The town will purchase a road roller, costing $3,235.

Westmount, Que.—The city will build a reservoir on Mount Royal in connection with its water works system.

Brandon, Man.—The city has an option on 538 acres of coal land near Bienfait with a view to municipal operation.

The Pas, Man.—The ratepayers will vote on a by-law for spending $130,000 on waterworks, sewers and electric lighting.

Sault Ste. Marie, Ont.—The city has engaged Willis Chipman, Toronto, to draft a scheme for a new sewerage system.

Edmonton, Alta.—Cost Engineer Bowness, superintendent of the Bureau of Efficiency, has prepared figures of the cost of a municipal incinerator.

Toronto, Ont.—Tenders will be received up to January 20, by the Board of Control, for a filtration plant with a capacity of 60,000,000 gallons a day. The estimated cost is $1,000,000.

Toronto, Ont.—By-laws authorizing the issuing of debentures to the amount of $963,890 for pavements between street railway tracks and $745,675 for water mains for revenue purposes were passed recently.

St. Thomas, Ont. — J. T. Lynn, Detroit gas expert, has advised the city to contract for natural gas. New mains costing $20,000 will be required. If the artificial gas plant is continued, $60,000 must be spent.

Marine

Sarnia, Ont.—It is believed that Sarnia and Port Huron will join to purchase a fire tug.

Sarnia, Ont.—The new steamer Noronic, of the Northern Navigation Co. arrived in Sarnia on Saturday to be fitted out during the winter.

Kingston, Ont. — The boilers of the steamer Geronia, are being removed and new water-tube boilers installed. She belongs to the R. & O.

Fisheries Cruiser "Malaspina."—The fishery protection cruiser Malaspina, the first of the two vessels being built for the Dominion Government, dropped anchor in Esquimault harbor on the morning of November 21, seventy-five days out from Greenock, Scotland. She made excellent time on her 15,000 mile voyage, via the Straits of Magellan, in spite of very rough weather off Rio de Janeiro, when the firemen had to work in water hip deep in the engine room.

Fort William, Ont.—The passenger steamer Athabasca will enter the dry-dock for the winter. She will be thoroughly overhauled before the opening of navigation next spring.

Ottawa, Ont.—Ulric Valiquette, supervising engineer of the Public Works Department, left November 27 for Esquimalt, B.C., to choose a location for the new dry-dock. It will be almost a complete duplicate of the dock now being constructed at Quebec.

Railways—Bridges

St. John, N.B.—The St. John Railway Co. recently installed a large new steam engine in their power house.

St. Mary's, Ont. — A scheme for a hydro radial line from London to Stratford through St. Mary's is on foot.

Vancouver, B.C.—The Dominion Government has promised a subsidy of $350,000 towards the bridge over the Second Narrows.

Ottawa, Ont.—The franchise of the Ottawa Electric Railway through Hintonburg, expires the year after next. The city may build the line.

Toronto, Ont.—The Government will start work this winter on an extension of the Temiskaming & Northern Ontario Railway to Gowganda.

Victoria, B.C.—Plans for the new Provincial Government bridge to be thrown across the Pit river at Dewdney Trunk road where a ferry now does service, are practically complete.

St. Thomas, Ont.—To place the local street railway in shape, $25,000 will be spent on additional lines. City Engineer Ferguson is making a report.

Owen Sound, Ont.—The Grand Trunk Railway Co. has made an offer to the Simcoe, Grey and Bruce Railway Co., relative to the taking over of the Meaford road, if built by the S. G. & B.

Victoria, B.C.—The Legislative Assembly will meet early in January for the purpose of dealing with three important proposals: Providing $25,000,000 as a subsidy for Mackenzie and Mann, in support of their railway construction work in this Province, passing a vote of $15,000,000 for Foley, Welch and Stewart, the railway contractors, and $15,000,000 for general purposes.

Ottawa, Ont.—Upwards of $12,000,000 will have been spent upon the Hudson Bay Railway scheme by the end of 1915. So far, including office expenses nearly $4,400,000 has been spent, and the three contracts for the railway proper aggregate $8,577,000.

Vancouver, B.C.—Steel structural operations have been started on the overhead bridge to be built by the C.P.R. from the foot of Burrard Street to the waterfront in connection with the other units of its big terminal improvement scheme. Material is being assembled and work is well under way with piers, the foundations for which have been ready some time.

Trade Gossip

New Supply Warehouse.—The Dominion Foundry Supply Co. have recently moved from 20 Pearl St., Toronto, to more commodious office and warehouse premises at corner Spadina Ave. and Richmond street. This move became

Personal

George L. Clark, city engineer of Saskatoon, Sask., has resigned.

J. H. Plummer arrived in Toronto from England on Sunday. He crossed on the Lusitania.

H. J. McCann, purchasing agent of the Dominion Steel Corporation, has returned to Sydney from a trip to the West.

E. W. Sayer, a well-known electrical contractor, will be an aldermanic candidate in the coming elections in Montreal.

H. A. M. McIntosh, C.E. of the Cedar Rapids Power Co. line construction staff, left for his home in Highland, Kan., last week to be married.

E. W. Knight, manager for Frankel Brothers, Toronto, dealers in metals, leaves this week for England on a vacation, and will not return until February.

G. F. Porter, engineer of construction of the St. Lawrence Bridge Company, Montreal, has been elected a member of the American Society of Civil Engineers.

F. A. Creighton, formerly power manager in Prince Albert, Sask., has opened an office as consulting engineer at 212 Carlton Building, Winnipeg.

Sir Phillip Watt, who is interested in the Armstrong, Whitworth Co., of Canada, Ltd., was in Montreal this week, accompanied by Mr. John Noble.

A. S. Cosler, who is in charge of the Toronto Paper Co. sulphite mill at Cornwall, Ont., nearly lost the sight of one eye last week in an accident while installing new machinery.

Walter V. Appleton, formerly assistant to the superintendent of motive power, I.C.R., has been promoted to be general master mechanic of the headquarters at Moncton, N.B.

Hugh Grey was presented by his fellow employees of Sheldons, Ltd., Galt, on Saturday, November 22, with a clock and carving set on the occasion of his marriage.

Sir Percy Girouard says that the Armstrong, Whitworth Co. whose plant is nearing completion at Longueuil, Que., will make only a high grade of steel for commercial purposes, and not armaments or ships.

W. M. Corse, works manager of the Lumen Bearing Co., Buffalo, has resigned to become general manager of the Empire Smelting Co., Depew, N.Y., which position he assumes on January 1. H. P. Parrock, sales manager of the Lumen Bearing Company, will assume

Give Your Friends This Handsome Xmas Gift

It gives pleasure the whole year round and is a constant source of delight, instruction and interest.

All the anxiety and trouble of searching for a valuable and appropriate gift for our friends is simply overcome by giving them a year's subscription of MacLean's Magazine—*Canada's National Monthly Magazine for the business man and his family.*

This makes a gift that is not soon forgotten like an ordinary gift is apt to be—The coming of this distinctive Canadian Magazine each month will recall your graciousness throughout the whole year.

Send in the name or names of your friends with $2.00 for a year's subscription and we will forward them the January issue—the first of the strong one's that will follow each month—The January copies will be ready for mailing on the 15th of December, and will reach your friends amid the Yule-tide Festivities.

The excellent nature of the subjects contained each month will be noted from these features which appear in January:—

CHARMING CHARACTER SKETCHES.

Each Issue portrays one or more snappy articles on Men of to-day.

MEN AROUND THE KAISER.

F. W. Wile's German sketches continue in Each Issue.

MONEY AND AFFAIRS.

Jno. Appleton, Associate-Editor, Financial Post analyses each month the financial outlook.

BEST BOOK OF THE MONTH.

Findlay I. Weaver, Editor Bookseller and Stationer, gives a racy account of successful books and authors.

THE UNUSUAL IN CANADA.

Always Some Interesting Articles on Other Topics.

SHORT STORIES AND SERIALS.

From 4 to 6 Best Short Stories and a laughable serial in each issue.

REVIEW OF REVIEWS.

Herein the Busy Reader can have the Best from Current Magazines condensed for him. This Feature excels in Interest.

Altogether don't you think that this is the Biggest Gift that you can give your friend. Try it.

Send the names of your friends in to-day to catch the early Christmas mail.

The MacLean Publishing Co., Ltd.

143 University Avenue, Toronto, Ont.

Mr. Corse's duties as superintendent, combining the two offices. Mr. Corse is secretary of the American Institute of Metals.

Arthur Baldwin has severed his connection with the Canada Iron Corporation, St. Thomas, and has taken a position with the Dominion Wheel Foundries, Ltd., Toronto.

Geo. Dakin, who has been at the head of the boiler department of the Bell Engine works at Seaforth, Ont., since that department was started eleven years ago, has severed his connection with the works, and returned to Galt.

A. E. WHITEHOUSE Montreal
76 GEORGE ST.

John Hazlett, for years chief engineer of the Calvin & Hepburn Companies, Kingston, Ont., died on Friday last, aged 66.

R. W. Farley, former city engineer of Hull, Que., died November 23 at his residence in Ottawa. He was the son of Robert Farley, civil engineer, Cork, Ireland.

Wallace Buell, formerly general sales agent of the Dominion Iron and Steel Co., died last week at Greenwich, Conn. He left the employ of the Steel Company in 1903.

Oswald Gurney Carscallen, 92 Adelaide St., W., Toronto, manufacturers' agent, formerly vice-president and secretary-treasurer of the Gurney-Tilden Foundry Co., Hamilton, died on Sunday last.

Catalogues

The Department of the Interior, Bureau of Mines branch, of the U. S. Government, has published a technical paper No. 51, entitled "Possible Causes of the Decline of Oil Wells."

The Smooth-On Mfg. Co., Jersey City, N.J., will send a circular dealing with their No. 7 iron cement for surfacing and stopping leaks in concrete, to any readers who are interested.

The Department of the Interior, Bureau of Mines branch, of the U. S. Government has published a technical paper No. 60, entitled "The Approximate Melting Points of Some Commercial Copper Alloys."

The Triumph Miniature Compressor is the subject dealt with in bulletin 510, recently issued by the Triumph Ice Machine Co., Cincinnati, O. The general design is described in detail, including special reference to the valves and lubrication. In addition to this, the installation features are dealt with. The illustrations are good, and special reference should be made to a sectional drawing in which every detail of the compressor is named. Diagrams with principal dimensions, are also given.

The Gray Manufacturing and Machine Co., Ltd., Toronto, have sent us copy of bulletin No. 11, which they have recently issued. The bulletin deals with the line of foundry equipment which they manufacture, including swing and floor grinders, polishing lathes, ladles, etc. Each type of product is illustrated and construction described, together with a specification covering the principal dimensions. Reference is made to other equipment made by the company for the foundry and machine shop. Copies of the bulletin may be had on request.

The Canadian General Electric Co., Toronto, have issued a new bulletin No. A. 4167, entitled "Electricity in Iron Foundries." The bulletin deals with the application of electric drive to foundry equipment, such as cranes, transfer cars, hoists, mills, etc. The subject is dealt with in a comprehensive manner and the illustrations show clearly several installations of motor driven equipment and its application under various conditions. A few pages are devoted to foundry lighting. installations of "Mazda" lamps being shown. Copies of the bulletin may be had by writing the company.

The Lea Equipment Co., Philadelphia, Pa., have sent us a copy of their latest bulletin (D) dealing with the Lea-Simplex cold metal saws, which are made in three sizes, motor or belt driven. A full description and illustrations are given covering the general design and construction of the saw, together with a specification of each size. The "Simplex" drive, one of the features of this machine is fully described and illustrated as also is the feed regulation attachment. The bulletin also contains a concise description and illustration of the "Simplex" hand grinder and bevelling machine. Copies will be sent to interested readers.

Hydraulic Valves and Fittings.—The Hydraulic Press Mfg. Co., Mount Gilead, Ohio. Catalogue No. 43. The first four pages cover the recent growth of the company and call attention to the special catalogs descriptive of the various designs of hydraulic presses and pumps which they manufacture. In the subsequent pages, the various types of hydraulic valves are handsomely illustrated and interestingly described. The valves are divided into four classes: Operating, Check, Knock-Out and Safety. A large variety of miscellaneous special valves is also shown.

The Joseph Dixon Crucible Co.—Engineers who keep a file of books for reference will be interested to know that the Joseph Dixon Crucible Co., Jersey City, N.J. still have a limited number of booklets dealing with such subjects as "Steam Traps," "Unions for Steam Pipes," "Feeding Graphite for Lubricating Purposes," etc., which will be sent free as long as the supply lasts, to anyone who cares for them. These treatises were prepared by the well-known engineer, W. H. Wakeman, who has written many articles on practical engineering problems. Numerous illustrations are used to make each subject easily understood. These booklets were printed some time ago, but are always desirable.

FIREPROOF MALLEABLE
PLANT IN CANADA

CASTINGS

High Grade Malleable Iron Castings
CAPACITY OF 5000 TONS
Let Us Quote Prices
CANADIAN MALLEABLE IRON CO. LTD.
OWEN SOUND, ONT.

CASTINGS

ALL CASTINGS
GUARANTEED
TO YOUR APPROVAL

STEEL CASTINGS

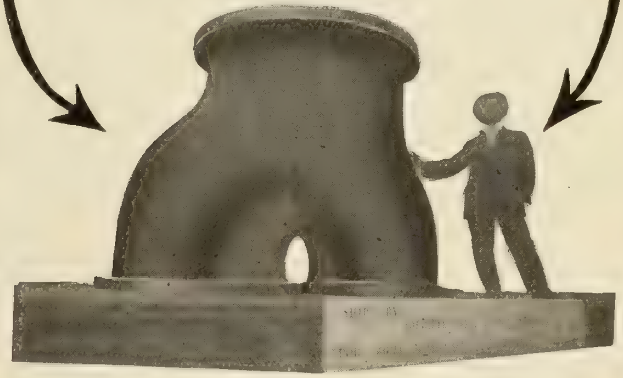
All Sizes, ¼ lb. to 30,000 lbs.

We make **New Process Converter Steel Castings, annealed and unannealed:** also **Chrome-Manganese and Nickel Steel Castings.**

Our Castings are perfect, yet they can be procured at a price that will ensure economy.

Every one guaranteed.

Ask us for estimates.



Casting for a 10,500 H.P. Water Wheel

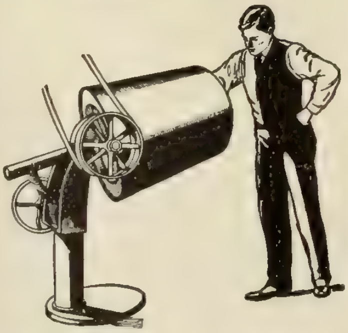
One Globe Barrel Paves the Way for Another



MANY a new customer starts with only one barrel on his first order. But after he has seen one barrel in operation—and has found how much faster it tumbles the work, how easily it is filled, emptied and the work inspected, he realizes that Globe Barrels are the only kind he can afford to use.

GLOBE TUMBLING BARRELS

do not have to be stopped for refilling, emptying or inspecting of work. One man can easily attend several barrels. He can keep them running steadily from morning 'til night and turn out a cleaner looking lot of tumbling than could be obtained with any other barrels.

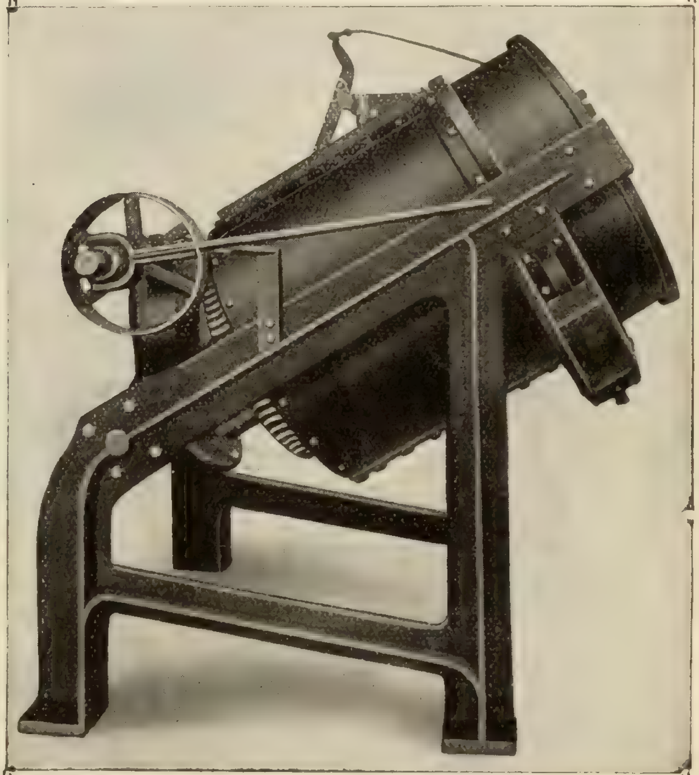
There are many other facts about Globe Barrels that you should know. Send for catalog 2 and post yourself.

8 *stock sizes—*$50 *to* $170.

THE GLOBE MACHINE & STAMPING CO.
Cleveland, Ohio, U.S.A.

The "No-Wear" Nozzle

An exclusive feature of the
"Sly" and Satisfaction



And there are many other features that make

"SLY" SAND BLAST MILLS

the last word in equipment of this kind.

HERE ARE A FEW OF THEM:

Massive and solid construction, with large wearing surfaces. Barrel of steel plate 1 in. thick. Sand and dust are thoroughly separated. Blasting sand is automatically returned to the nozzle for continued use.

Perfect balance of the machine makes 1 or 2 H.P. sufficient for operation.

Machine can be adjusted without stopping.

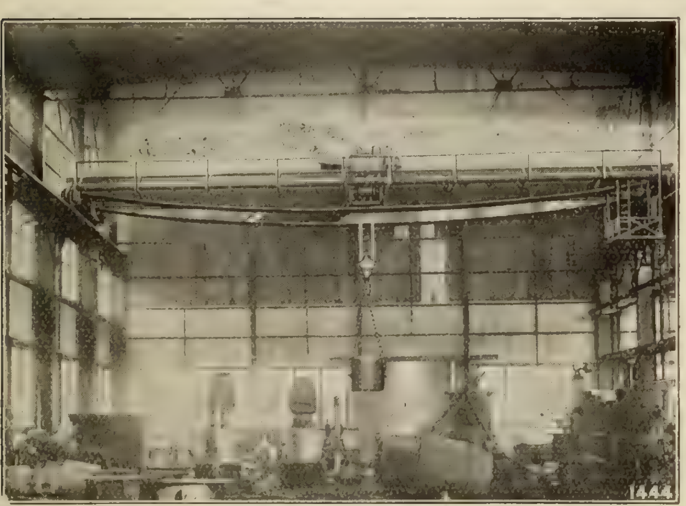
We will be pleased to get you in touch with users, so that you can profit by their experience.

Ask for full particulars.

The W. W. Sly Mfg. Co.

CLEVELAND, OHIO

Complete Sand Blast Rooms and Equipment a Specialty



Electric and Handpower Cranes

For any service, span or capacity.

Our designs are the result of many years' experience in building cranes and can be depended on for reliable and efficient service. Special attention given to safety and accessibility. Let us figure on your crane problems.

Williams White No. 2 Eye Bender

These machines are made in two sizes, and are adapted to a great variety of bending, not only eyes and rounds, but angles and special shapes.

The No. 2 Machine will handle work as large as 1½ inches in diameter, with a large eye down to the smallest.

The No. 1 Machine handles iron up to ¾ inches, or even one inch in diameter, with an easy eye, but we do not recommend it for other than light work.

Send us drawings of work you wish to do and we shall be pleased to quote on proper machine.

76-in. Special Girder Radial Drill

Designed and built by us to meet the special requirements of Bridge and Structural Steel Works.

We have supplied 49 of these machines to several large bridge builders.

CANADA MACHINERY CORPORATION, LIMITED
GALT - - ONTARIO

Builders of Machine Tools and Woodworking Machines

We Have Met the Demand

The unusual success attained by our 14″ Vertical Surface Grinder has created a demand for a larger model to handle work beyond the capacity of the smaller machine. To meet this demand we have designed the grinder shown below—a powerful, heavy machine, using a 22″ grinding wheel.

Capacity

22″ Grinding Wheel,
Either 4′ or 7′ Table.

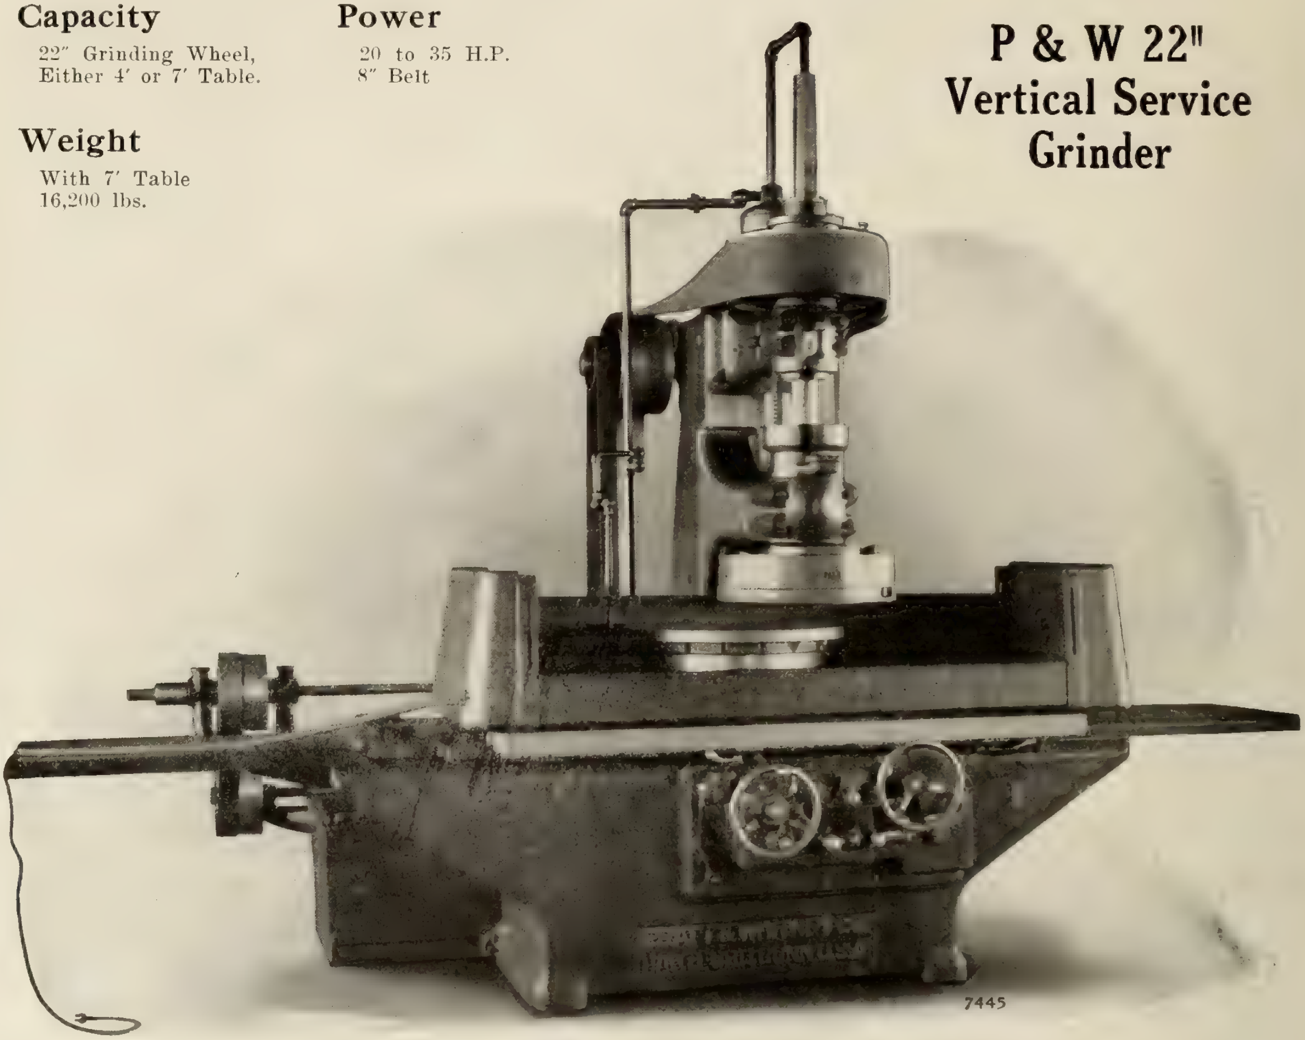
Power

20 to 35 H.P.
8″ Belt

Weight

With 7′ Table
16,200 lbs.

P & W 22″ Vertical Service Grinder



Massive Construction

Special attention is called to the unusual proportions and massive design of this new surface grinder. The machine has been designed with the idea in view that it must have unquestioned stability, an abundance of power and must retain its accuracy under the most severe service.

Ball Bearings

The spindle and driving pulley are provided with ball bearings throughout. Loss through friction is thus reduced to a minimum and practically the entire power is utilized for driving the wheel.

Power Traverse for Table

In addition to two power feeds, the table is provided with power quick return motion for use in connection with rotary chucks.

Flexible Work-holding Devices

The various work-holding appliances are very flexible and will accommodate a wide range of work. The machine may be furnished with rectangular reciprocating, and single, double and quadruple rotary chucks of either plain or magnetic type.

Write for ''Progress Reporter'' No. 24, containing description of this grinder and several other new machines.

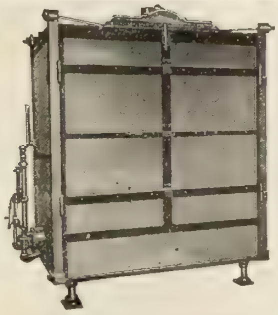
THE CRAWFORD SECTIONAL OVEN
PAT'D NOV. 20, 1906
THE OVEN EQUIPMENT AND MFG. CO. NEW HAVEN, CONN.



Standard Type B Sectional Oven

It Can't Be Done!

You can't get the best results in enameling, japanning, bluing, lacquering or baking and drying cores and molds unless your oven is right. Circulation, ventilation, temperature control, insulation—**all** of these must be right and **are right** in

CRAWFORD Sectional Ovens

Positive circulation is assured by the use of a blower which fills the over with preheated air and forces waste gases and fumes out of the pipe vent. Heat is uniformly distributed by means of the famous patented **Enclosed Flame Gas Burner**, which is so safe that the Underwriters will permit its use in any building, while open flame burners are barred from most types of structures. Equally good results are obtained whether the oven is filled to the roof or only partially filled.

If you are having trouble with your equipment it will pay you to investigate the Crawford. Successive repeat orders from satisfied customers are evidence of its merit. State your problem and we will show you how it can be met.

A NEW EDITION
OF OUR
BOOK MILLING SUGGESTIONS

is just out and we want you to have a copy.

This book illustrates a large number of operations besides the one shown here. It gives speeds and feeds and other interesting facts. It makes no difference what kind of a milling machine you are using, you will find this book interesting.

¶ It tells how several jobs have been transferred from the lathe to the miller with an enormous saving.

¶ It tells how improved jigs have cut down the former milling time.

¶ It shows our new heavy duty Lincoln Miller in action.

This book is free to anyone sending us the coupon. Send it now while you think of it.

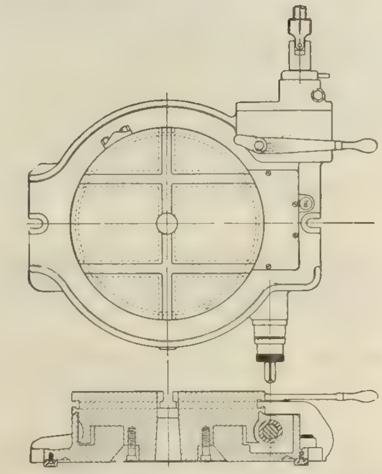
WHY MILWAUKEE MILLERS
Are Built Exactly As They Are

No. 18—
Rotary Table

The rotary table lends itself readily to a great variety of uses, one of the chief of which is continuous milling of pieces that are to be produced in large quantities.

On work suitable to this operation a truly remarkable output may be secured. The cutter is continuously at work, and the operator's time is devoted solely to chucking rough pieces and unchucking finished pieces.

This class of work may be done on either vertical or horizontal machine, or on a horizontal with vertical spindle attachment.



The points which distinguish the rotary table for Milwaukee Millers from other similar attachments are points that make for an extreme of accuracy and rigidity.

It will be seen in the line drawing herewith that the table is almost a solid mass and that the worm wheel is nearly as large in diameter as the table itself. The worm has coarse pitch and is supplied with ball bearing thrust collars.

The table is so arranged that the index plates used on dividing centers interchange with the rotary table. In this way dividing can be done on the rotary table for the purpose of cutting large gears and similar work.

The table is of minimum height considering its strength, thus bringing the work down closer to the knee and reducing cutting strain.

The full facts regarding Milwaukee Millers and their attachments will interest every milling machine user. They are given in our Bulletins. Write for your copies.

Speeding up Micrometer Measurements!

Every shop in the country is devoting time to the question of increasing the speed of production. Each process is timed and analyzed to eliminate unnecessary operations. Here's a suggestion to efficiency experts who superintend men making frequent measurements. Provide each man with a

STARRETT
Quick Adjusting Micrometer

and see how much quicker he will turn out the work
and how much better satisfied you will be with it.

This micrometer embodies one of the finest improvements to an instrument of precision that has ever been made. In the handle is a plunger which under slight pressure from the finger releases the nut on the micrometer screw and permits the spindle to *slide* to its adjustment. The plunger may then be released and the final accurate adjustment made as usual.

Simple, isn't it? Well, we have lots of Starrett tools that can accomplish just such results in their line. We want every man who is interested in time-saving on measuring operations to get in touch with us.

Let us send you catalogue 203 which describes the full Starrett line.

Impressions from Counterfeit Places and Things

¶ In our great cities—and in smaller towns as well—we find a form of sickly anti-naturalism which seems to overtake at least 80% of the race, and which is manifested everywhere in arrested development. While arrested development is most conspicuous in the country and in small country towns—the glamor of life—the artificial side—is pursued in greater degree in larger towns and cities, because of the conditions which make this glamor and artificiality possible.

¶ After we permit ourselves to drift into an unhealthy physical and mental state, we find that it is easier to follow the sickly imitations and follies of life, than it is to adhere to the higher laws and principles that govern our nobler instincts. The physical and mental change which makes this attitude possible is similar in every sense to the organic change that takes place after the formation of a drug habit. It requires, perhaps, a period of two years to trade our healthy instincts for the deadly drug of pretense and glamor—for the poison of the superficial and artificial.

¶ In cheap theatres, cafes and dance halls our natural appreciation of the beautiful is appeased by gaudy colors and tawdry decorations, and these sickly imitations are accepted for the reality which they imitate. The Path of Folly which leaves its trail of dried and faded cheeks, blurred and milky eyes, coarse and guttural speech, leads from us in all directions toward these gilded and painted nothings. We are quickly impressed by the surface of things—by the effete, and unless we are alert and active, our healthy instincts become diseased and die one by one. It is then that we become the charred stump of the magnificent tree that we might have been.

¶ The reason that any perverted desire, that any injurious or pernicious habit continues at all is that perverted desires are founded upon a natural instinct, which instinct is a natural desire for recreation and change. Every man, woman and child possesses a natural desire for recreation, for change of environment, for new surroundings, and this natural desire in the majority of people is satisfied with the bizarre, the gaudy and the gilded.

¶ Many of us live out our entire existence without ever having seen anything but the alleys and ashcans of life, without ever travelling high enough to discover the relationship between ourselves and nature. Most of us never explore the sky and clouds at day-time—never look up to enjoy the stars at night; yet there is at Sea of Beauty that bathes the entire universe, and which is always there for all of us to set sail upon as we will. But we are too busy chanting and singing and rehearsing the little insignificant things of our everyday life.

¶ Once we forget the out-of-doors, once we forget the value of fresh air, once we fail to remember the utility of exercise, we are on the down grade. Our perspective of life and of people is becoming narrow and one-sided, and we are degenerating just as surely as the healthy, natural dance of the mountaineer of the time of Robin Hood has degenerated into the stupid dance of our modern ball-rooms and cafes—where the air and the atmosphere are pervaded with cigarette smoke and the fumes of stupid drinks and poorly prepared food.

¶ Unless each day we possess a desire to ascend to heights to which we have not climbed, and descend to depths of understanding which we have not yet explored, we cease to grow, and finish the Race of Life with our mentality developed just a little more than that of the child, yet stripped of the child's activity, interest and imagination.

Efficiency

INDUSTRIAL NOTABILITIES--No. 12

Most people remember what a lot of talk there was in 1910 when M. J. Butler resigned his position as Deputy-Minister and Chief Engineer of the Department of Railways and Canals, and left Ottawa to become general manager of the Dominion Iron and Steel Co. He was a valued government engineer, but it was pointed out that industrial concerns who are in need of master minds, will offer much larger salaries than the Government, and it was so in this instance. The case was somewhat similar to that of Sir Percy Girouard, formerly of the diplomatic service, Governor of Nigeria, who resigned to accept a position with Armstrong, Whitworth & Co., the shipbuilders and gunmakers of Newcastle-on-Tyne. Both were Canadians, and it is a singular coincidence that these two men are now associated with one another in the operation of a steel plant, built by Armstrong, Whitworth & Co. at Longueuil, near Montreal.

Mr. Butler is one of the few eminent Canadian engineers who have been honored by the Crown. His Late Majesty, King Edward VII., realizing the distinguished services performed by him as Deputy Minister of Railways and Canals, and as Chairman of the Board of Management of the Canadian Government Railways, conferred on him the order of C.M.G.

His experiences in the engineering profession have been wide. He started as a land surveyor in Ontario in 1878, went from that to an American railway as buildings and water service engineer, and then spent three years in the wood pulp business. He came back into the railway business, and gradually worked himself up to the position of Deputy Minister of Railways. Then he made another change by entering the employ of the Dominion Iron and Steel Co., resigning in 1912. Nothing much was heard of him after that date until recently, when it was announced that he had been appointed general manager of the Armstrong, Whitworth & Co. of Canada, a company recently incorporated at Ottawa with a capital of $2,000,000.

MATTHEW JOSEPH BUTLER.

M. J. Butler was born at Deseronto, Ont., fifty-seven years ago. His father was Tobias Butler, and his mother, before marriage, was Elizabeth McVey, both of Irish ancestry. When fifteen years of age he studied law at De La Salle Institute, Toronto University, and afterwards served three years at surveying, engineering and architecture, and in 1878 was appointed Provincial land surveyor. In 1885 he went to the States, and worked for a while for the Atcheson, Topeka & Santa Fe Ry. in Kansas and Colorado. In 1890 he became chief engineer of the Bay of Quinte Railway & Navigation Co., and in 1903 was superintendent of construction for the Locomotive & Machine Co., Montreal.

He is a member of the Institution of Civil Engineers of London, Eng.; of the American Society of Civil Engineers; of the American Society of Mechanical Engineers; of the Canadian Society of Civil Engineers; of the American Geographical Society; of the American Society for the Advancement of Science; and among clubs, he is a member of the Rideau of Ottawa; the University Club of Montreal, and the Mount Royal Club, Montreal.

Mr. Butler was married Nov. 13th, 1880, to Loretta Melissa Jane Shibley, the union bringing five children.

Determining the Cutting Power of Lathe Turning Tools[*]

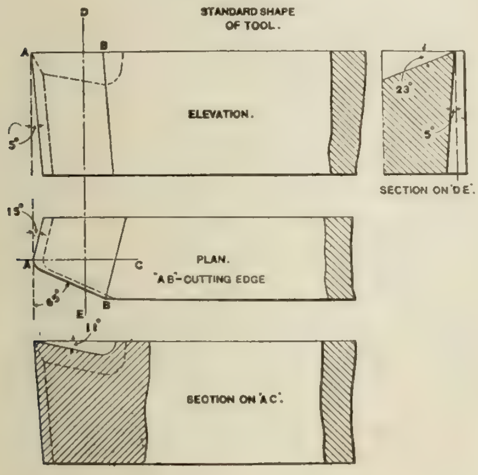
By William Ripper, D. Eng. D.Sc. and G. W. Burley[**]

The question of the definite measure of the output of work, or of the removal of material, of which lathe-tools are capable, is one about which there is very little information readily available; and it was for the purpose of determining the behavior of cutting tools over a fairly wide series of working conditions, and of deducing therefrom some practical results, that the experiments here detailed were undertaken.

THE object of the tests here described and illustrated includes the determination of the way in which the output of both high-speed and ordinary carbon-steel tools is affected by such elements as the speed of cutting, the depth of the cut, the feed of the tool per revolution of the work, the shape of the nose of the tool, and the physical properties of the metal upon which the cutting tool is acting. In particular, the question of the association of a high speed and a light cut versus the association of a low speed and a heavy cut, received consideration with a view to finding the relation of these two factors to maximum output.

Fig. 1

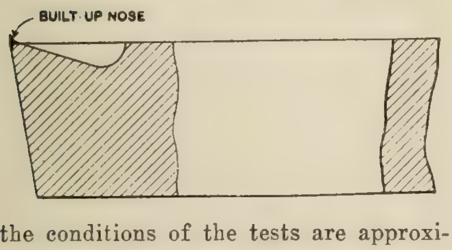
STANDARD SHAPE OF TOOL.



Further points were to determine whether the above relationships are on the whole as regular and uniform as they may reasonably be expected to be when the conditions of the tests are approximately uniform; or whether they are irregular and erratic as they have sometimes been reported to be; also whether the usual workshop notions as to the durability of tools at varying cutting speeds are confirmed by careful experiment.

Fig. 3.

DIAGRAM SHOWING BUILT-UP NOSE.



Types of Tools Tested.

Two classes of tools were tested—namely, ordinary carbon-steel tools and high-speed steel tools. By the term carbon-steel tools is meant tools made of ordinary tool-steel as distinguished from those made of self-hardening steels and high-speed steels. The characteristic composition per cent. of carbon tool steel is approximately as follows:—

Fig. 2.

DIAGRAM SHOWING METHOD OF MEASURING WEAR.

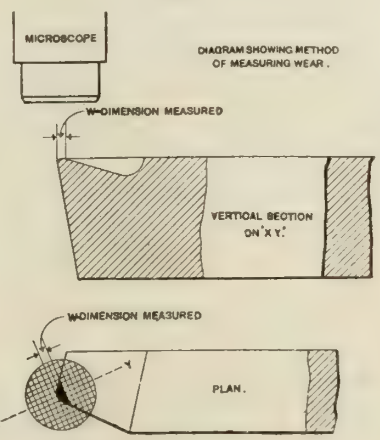


Fig. 4.

Carbon	1.3
Silicon	0.12
Manganese	0.2
Sulphur	0.02
Phosphorus	0.01

Its characteristic behaviour as a cutting tool is that it possesses the property of becoming hardened by heating and quenching, and of retaining its hardness while working as a cutting tool up to a temperature at the nose of about 300 degs. C., beyond which temperature the hardness disappears and the cutting edge of the tool softens.

By the addition, however, of certain materials in the manufacture of carbon tool-steel, the temperature of stability of the hardness, or, in other words, the temperature at which the steel softens or breaks down, due to the heat generated by friction at the nose of the tool, is raised, and the ability of the tool to cut is greatly improved. The first step in this direction was made by the addition of tungsten to the ordinary carbon-steels forming the celebrated Mushet or self-hardening steel, and raising the temperature of the softening point to about 400 degs. C. Later, by the further addition of chromium, and afterwards of vanadium, we have the still more celebrated high-speed steels with a considerably increased temperature of stability of their hardening properties, the steel

retaining its cutting edge for a short time, even at a visible red heat.

The increased working temperature of the steel thus produced by the addition of these metals to ordinary carbon-steels has resulted in increasing enormously their capacity for output by increasing the possible cutting speeds, as well as the possible depths and feeds of cuts taken.

Carbon-Steel Tool Tests.

The ordinary carbon-steel tools tested were made from ¾-inch by ½-inch bars, 6 inches long, and the tools were ten in number. The shape of the tool nose adopted as the standard shape for the first set of tests was that indicated in Fig. 1, in which an elevation and plan of the nose are shown. The side cutting edge AB is horizontal and inclined at an angle of 25 degs. to the length of the tool, so that when the tool is in its correct position in the slide rest, the cutting edge makes an angle of 65 degs. to the axis of the work or test-bar between the centres. The end of the tool is inclined at an angle of 75 degs. to the length. The angles of the tools were as follows:

Top rake—front=11 degs. Front or heel clearance = 5 degs.

Side rake = 23 degs. Side clearance = 5 degs.

These angles were ground exactly, on every tool tested, on a Universal tool grinder, so that the question of the angles of the tool did not affect the comparative results in the first part of the research.

Test Bars.—The test bars on which the carbon-tools were tested were steel bars of various chemical compositions and physical properties, four different classes being worked upon, marked W. X, Y, and Z, and varying in composition from 0.23 per cent. of carbon to 0.82 per cent. of carbon. The bars were made from ingots cast in the metallurgical laboratories of the University of Sheffield, under the direction and with the kind co-operation of Dr. J. O. Arnold, F.R.S., and were about 2 feet 6 inches long and 6 inches in diameter when finished, after hammering and annealing.

Test Lathe.—The tests were made in a 6 foot by 6 inch centre Lang lathe fitted with a variable-speed gear, so that fine adjustments of cutting speed could be obtained through a fairly wide range; this range being from 10 feet per minute to 300 feet per minute on a diameter of 6 inches.

Measure of Standard of Bluntness of Tool.—The method adopted in testing these tools involved the microscopic examination of the cutting edge, this being found to be the only possible method of establishing a standard of measure of the working life of the tool. Each tool was allowed to cut for a certain number of minutes at a selected speed with a selected area of cut (depth of cut by feed of tool per revolution of test-bar), at the end of which time the tool was removed from the tool-holder and then placed under the microscope for the purpose of examining the cutting edge to see to what extent the edge had been dulled or blunted. A micrometer screen in the eye-piece of the microscope enabled the amount of the blunting to be measured. The dimension, which was measured in each case, is indicated in Fig. 2. The degree of blunting, as it may be termed, was not in any case of a uniform width along the nose of the tool, but the width actually measured (that is, the dimension W) was the greatest width that could be found under the microscope in each case. To determine the limiting duration of the test, that is, the duration to produce unit bluntness, three and sometimes four tests and microscopic examinations were made on each tool at one constant cutting speed and area of cut, the tool being measured for bluntness after each test, and then replaced in exactly the same condition and position in which it was when removed from the lathe. Thus, the values of W corresponding to three or four durations were obtained, and

Fig. 14.

from these results curves were plotted, and the duration of the test which corresponded to what was adopted as the "unit" or "standard wear" was found by measurement from the curves.

In no other way was it found possible or practicable to obtain this duration satisfactorily. The "unit" or "standard wear" adopted finally was 0.005 inch, as this was found to be about the average amount of blunting which is usually allowed on the cutting edge of a carbon-cutting tool in practice before it is re-sharpened. In the plan, Fig. 2, the squares are ruled on the micrometer screen to the standard width, and W is shown equal to 1.9 units or 1.9 by 0.005, that is, 0.0095 inch.

This method of testing the durability of tools was finally adopted after repeated failures to find a method of determining a standard breaking-down point for the tool. One difficulty arose from the almost invariable tendency of the tool to build up a new nose, or new cutting edge, on the point of the original one, as shown in Fig. 3. This new nose appeared to form a protecting cutting edge for the tool and to prolong indefinitely its life, but on examining the matter more closely it was found that, although a sharp nose was being presented to the work, a cumulative blunting action was going on all the time on the cutting edge of the tool below the false nose.

As soon as this blunting effect was discovered, it became an easy and straightforward task to find a measure of bluntness of the given tool for any given duration of cutting speed and dimension of cut. The false nose is formed by particles scraped from the work, which form themselves into a solid mass between the chip, the work, and the nose of the tool, the false nose becoming larger as the tool itself becomes blunter; the blunting of the tool itself being due apparently to the pressure transmitted to the cutting edge of the tool through the superimposed material. The built-up nose had, of course, to be removed before a microscopic examination of the bluntness of the cutting edge could be made.

Relation Between Wear of Tool and Duration of Test.

Representative curves showing the relation between the wear of the cutting edge (or the above dimension W) and the duration of the test are given in Figs. 4-11. Each set of curves constituting the whole figure represents experiments made with a definite area of cut—depth of cut by feed of the tool per revolution of the test-bar. Each curve represents experiments made at a definite cutting speed. The areas of cut and test-bar designation numbers for which these Figs. 4-11 stand are as follows:—

		Inch		Inch		
Fig. 4—Area of Cut	=	0.020	×	1-36	............Bar W	(Mild Steel)
Fig. 5—Area of Cut	=	0.120	×	1-36	............Bar W	(Mild Steel)
Fig. 6—Area of Cut	=	0.020	×	1-36	............Bar X	(Medium Steel)
Fig. 7—Area of Cut	=	0.120	×	1-36	............Bar X	(Medium Steel)
Fig. 8—Area of Cut	=	0.020	×	1-36	............Bar Y	(Hard Steel)
Fig. 9—Area of Cut	=	0.120	×	1-36	............Bar Y	(Hard Steel)
Fig. 10—Area of Cut	=	0.020	×	1-36	............Bar Z	(Very Hard Steel)
Fig. 11—Area of Cut	=	0.120	×	1-36	............Bar Z	(Very Hard Steel)

The following is a complete list of all the areas of cut used in the tests with carbon-steel tools, these being used on each of the four classes of test-bar:—

Depth of Cut.		Feed per Revolution.			
Inch.		Inch.	Inch.	Inch.	Inch.
0.020	×	1-12	1-24	1-36	1-48
0.040	×	"	"	"	"
0.080	×	"	"	"	"
0.120	×	"	"	"	"

An important limitation to the size of cut is the heavy cost of material used up during the tests; but although the areas of cut taken are small, they include the conditions under which a very large proportion of the machine-tool work of the world is done. Altogether about 320 cutting-speed and cut-area combinations were taken, involving the making of about 1,000 individual micro-examinations of the cutting edges of the tools. In all cases the work has been run dry, that is, without lubrication at the cutting edge of the tool.

Cutting Speeds to Produce Standard Bluntness.

From each set of wear-duration curves, Figs. 4-11, the durations for standard or unit bluntness at the selected cutting speeds were measured, and these were utilized to form speed duration curves, such as are shown in Figs. 12-15. Thus, on Fig. 4, the dots or points indicate the results of actual measurements of wear for given cutting speeds; then, by noting the points of intersection of the horizontal line of unit bluntness, with the respective curves, the corresponding durations are obtained. These results, arranged as a separate figure, form the curves of duration for unit or standard wear at given cutting speeds. Each curve of this set corresponds to one set or batch of curves of the wear-duration variety. These four figures contain representative curves for each of the four test-bars as follows, the areas of cut being as given:

Fig. 12—Bar W.......Areas of Cut = 0.02, 0.04, 0.08, and 0.12 × 1-24 in. feed.
Fig. 13—Bar X.......Areas of Cut = 0.02, 0.04, 0.08, and 0.12 × 1-24 in. feed.
Fig. 14—Bar Y.......Areas of Cut = 0.02, 0.04, 0.08, and 0.12 × 1-24 in. feed.
Fig. 15—Bar Z.......Areas of Cut = 0.02, 0.04, 0.08, and 0.12 × 1-24 in. feed.

These curves, owing to their tendency to become horizontal, seem to indicate that there is a cutting speed for each area of cut and each test-bar, beyond which the tool would last more or less indefinitely under the given conditions; in other words, it would cut efficiently for many hours, but if this speed is exceeded by from 15 to 25 per cent. the conditions are such that the tool will fail somewhat rapidly.

Effect of Hardness of Bar on Cutting Speed.

Comparisons between the four test-bars in regard to the relation between the cutting speed and the cutting time are made in Fig. 16. The area of cut selected is 0.040 inch by 1-24 inch, and the tools are run at a given speed until they reach standard bluntness. The figure shows that, for any given cutting time the harder the bar the lower the cutting speed, the ratio of the cutting speeds for any given life of the tool being approximately equal to the inverse ratio of the carbon contents of the bars. Thus, for an 80 minutes' run, the cutting speed, Fig. 16, for the hard bar ($C = 0.82$) is 5 feet per minute, and the cutting speed for the soft bar ($C = 0.23$) is 15 feet per minute; that is, the cutting speeds are, roughly, inversely proportional to the carbon contents, as also to the tensile strength. The exact degree in which the cutting speed is affected by the tensile strength of the bar is given later.

It also shows that, for all the bars, the high cutting speeds are associated with the short durations or times of cutting, so that if the cutting speed is increased the time of cutting required to produce the standard amount of wear is reduced. The relationship between the increase of speed and the reduction of time is not a very simple one, but, for cutting times between 10 minutes and 100 minutes, the average duration is found to be:—

$$M = \frac{\text{constant}}{S^5} \quad . \; . \; . \quad (1)$$

where S = the cutting speed in feet per minute, and M = the time of cutting in minutes, required to produce the standard amount of wear on the cutting edge of the tool. That is, the duration of cutting is approximately inversely proportional to the fifth power of the cutting speed. The value of the constant depends, of course, upon the test-bar, or the composition and properties of the metal being machined, and the area of cut.

Standard Tests.

To systematize matters it was decided to make a standard test, which should produce a condition of unit bluntness of the cutting edge of the tool after a 60 minutes' run. This unit bluntness in 60 minutes could be obtained in various ways by a series of combinations of speeds and areas of cut. These results were then combined into one curve, as shown in Fig. 17, the upper curve representing such a series for the mild steel test-bar W, and the lower curve representing respectively the other bars of gradually increasing hardness X, Y, Z.

Fig. 16.

EFFECT OF HARDNESS OF BAR ON CUTTING SPEED AND DURATION TO PRODUCE STANDARD BLUNTNESS.

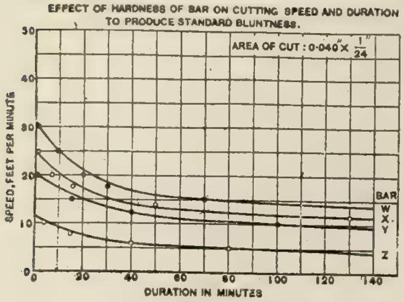

Fig. 17.

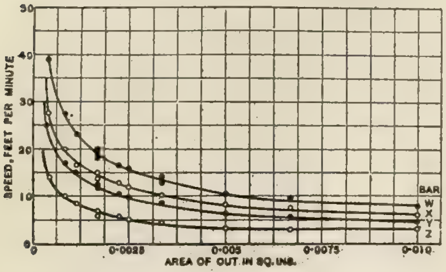
RELATION OF CUTTING SPEED TO AREA OF CUT TO PRODUCE STANDARD BLUNTNESS IN 60 MINS CARBON TOOLS.



With each given area of cut there is a certain speed which will produce standard bluntness in 60 minutes, this speed having been termed the "associated" cutting speed for the given area of cut. In this series it has not been found necessary or possible to separate the two factors of depth of cut and feed, which make up the area of cut, because with carbon tools in practice the cuts are comparatively light, and the differences of result produced by changing the ratio of these factors are so small as to be almost negligible. The relation between the area of cut and the associated cutting speed is found to obey approximately the law:

$$AS^2 = \text{a constant} \quad \ldots \quad (2)$$

$$\text{or } S = \frac{\text{constant}}{\sqrt{A}} \quad \ldots \quad (3)$$

where A = area of cut, and S = cutting speed in feet per minute. The value of the constant depends upon the composition of the bar.

Output Curves.—From the curves, Fig. 17, the speed associated with each area of cut was measured, and with these factors the output or the number of cubic inches of material removed per hour was calculated, and the curves, Fig. 18, constructed therefrom. The ordinates of the curve = area of cut × cutting speed × 12 × 60 = cubic inches turned off per hour.

Effect of Hardness of Test-bar, Speed, and Cut-area on Output.—It will be seen from Fig. 18 that for any given cutting speed with its associated area of cut, to give the tool a life of one hour, the volume of metal removed is greatest with the softest bar and least with the hardest. It also shows that large output is by no means associated with high cutting speed, but that as the cutting speed is reduced with, of course, a suitable increase in the area of cut, the output is increased; in other words, a heavy cut is better than a high cutting speed.

Fig. 18.

EFFECT ON OUTPUT OF INCREASED CUTTING SPEED WITH ACCOMPANYING REDUCED AREA OF CUT.
CARBON TOOLS.

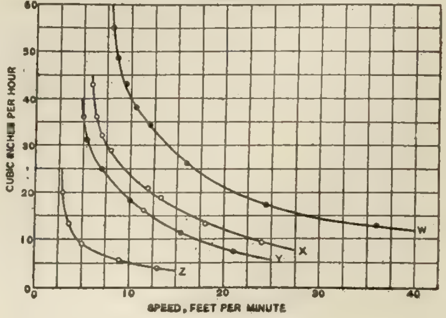


Fig. 19.

EFFECT ON OUTPUT OF INCREASED AREA OF CUT WITH ACCOMPANYING REDUCED CUTTING SPEED.
CARBON TOOLS.

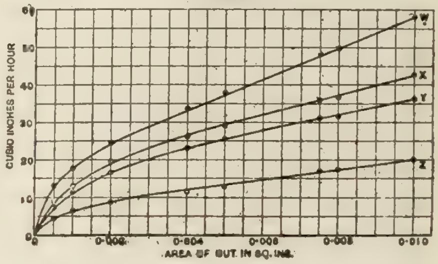

Fig. 20.

RELATION OF STANDARD CUTTING SPEED TO TENSILE STRENGTH FOR VARYING AREAS OF CUT.
CARBON TOOLS.

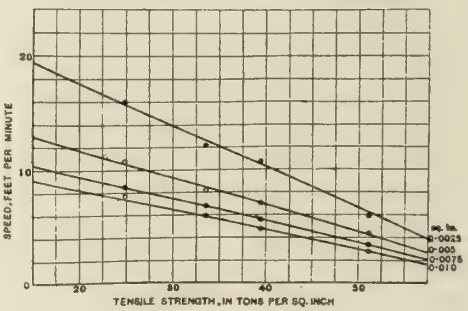

Fig. 21.

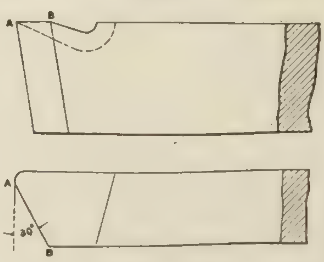
PLAN AND ELEVATION OF TOOL WITH LONG CUTTING EDGE "A B".



Thus it will be seen that, for bar W, when the cutting speed is 10 feet per minute, the volume of metal removed per hour is 40 cubic inches when the associated area of cut for this speed is used; whilst when the speed is, say, 20 feet per minute, and the associated area of cut is correspondingly less, the volume removed is only about 21 cubic inches. Hence, as a general law, it may be stated that for maximum tool output the area of cut employed is a maximum and the associated cutting speed is correspondingly low.

This is also indicated in Fig. 19, which gives the relation between the volume of metal removed in the hour under the standard conditions, and the area of cut It will be seen that the greater the area of cut, accompanied by its appropriate or "associated" cutting speed, the greater the volume of metal removed. In other words, a low cutting speed and heavy cut combination is preferable to a high cutting speed and light cut combination from the point of view of output. Fig. 19 shows further that with a fixed area of cut and its accompanying associated speed, the ratio of the output on steels of varying hardness is inversely proportioned to the tensile strength of the material being machined.

Relative Hardness of Material as Measured by Tensile Strength.—To determine the relative hardness of the material turned, many methods were tried, but it was ultimately found that the test of the tensile strength of the material was the most reliable and conveniently-made test of relative hardness, the hardness being practically directly proportional to the tensile strength. The crushing test of a sample compression piece would seem to be the most reasonable test of hardness of a material, but

Fig. 22.

DIAGRAM SHOWING EFFECT OF SHAPE OF NOSE UPON LENGTH OF CUTTING EDGE OF TOOL.

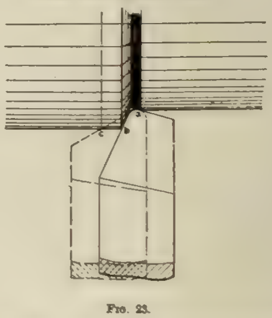


Fig. 23.

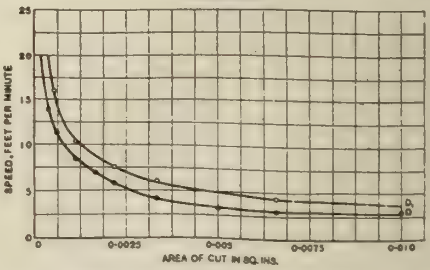
CURVES SHOWING EFFECT OF LENGTH OF CUTTING EDGE ON CUTTING SPEED.
CARBON TOOLS.



the comparative hardness determined in this way was as nearly as possible similar to that obtained by comparing the tensile strengths.

Relation between Tensile Strength of Material and Cutting Speed of Tool.—In Fig. 20 is shown the relationship between the tensile strength of the metal being machined and the associated or working cutting speed for four different areas of cut, the speed and the area of cut being associated to give a standard life of 60 minutes to the tool. The law is a straight-line law, the equation to it being:—

$$S = \frac{(67-T)\times 0.0185}{\sqrt{A}} \qquad (4)$$

where S = the associated cutting speed in feet per minute; T = the tensile strength of the metal being machined in tons per square inch; and A = the area of cut in square inches.

Effect of Shape of Nose of Tool on Cutting Speed.—To determine the effect of a change in the shape of the nose of the tool, and in the disposition of the cutting edge with respect to the axis of the test-bar, tools having a shape of nose as represented in Fig. 21 were tested against tools of the shape of Fig. 1 (see Fig. 22). The same conditions as to test were adopted in each case, that is, the tools were tested for wear of the cutting edge, with a standard tool life of 60 minutes.

Under these conditions, the relation between the cutting speed and the associated area of cut was determined. This relation is indicated graphically in Fig. 23, the curve D_1 being obtained with the form of tool nose represented in Fig. 21, and the curve D with the original or standard shape of nose, Fig. 1. It will be seen that for each area of cut the associated cutting speed is less for the standard shape of nose, which has a comparatively short cutting edge (a, b, Fig. 22), than it is for the second shape of nose, which has a longer cutting edge (a, c, Fig. 22). These speeds have an average ratio of 1 to 1.40, which ratio is also approximately that of the length of the respective cutting edges of the tools in contact with the work.

In other words, for a given depth of cut, the associated cutting speeds of tools for a given amount of wear are directly proportional to the length of the cutting edge of the tool in contact with the work, that is, a proportionately greater output can be obtained with the tool having a longer cutting edge. In all other respects the angles of the tools were the same.

Summary of Conclusions.

1.—Blunting of the cutting edge develops more rapidly at high speeds than at low speeds, given the same area of cut, and the same shape of nose of tool.

2.—The durability of carbon-steel tools is in all cases some function of the reciprocal of the cutting speed, in other words, the higher the cutting speed the shorter the durability of the tool, and vice versa.

3.—Assuming a standard amount of bluntness of 0.005 inch, the cutting speed to produce this bluntness is inversely proportional to the fifth root of the duration or life of the tool for durations between 10 and 100 minutes for any given area of cut, or conversely the life of the tool is inversely proportional to the fifth power of the cutting speed. This law does not hold good for durations which are external to these limits.

4.—The cutting speed duration curve beyond the point representing a duration of 100 minutes tends to become horizontal, this suggesting that there is, in each case, a definite cutting speed below which the tool would last practically an indefinite length of time.

5.—For a standard tool life of 60 minutes and a standard amount of bluntness of 0.005 inch, as determined by means of the microscope, high cutting speeds are invariably associated with light cuts, and low cutting speeds with heavy cuts.

6.—The associated cutting speed for a given area of cut is not influenced by the manner in which the area of cut is made up— that is, the influence of the depth of the cut upon the associated cutting speed is exactly the same as that of the feed. This applies only to carbon-steel tools with which cuts of small area only are possible; with high-speed steel tools this condition does not apply.

7.—The associated cutting speed is not reduced or increased in the same ratio as the area of cut may be increased or reduced.

8.—The associated cutting speed for any area of cut depends upon the hardness of the metal which is being machined, a high speed being associated with a low degree of hardness or vice versa.

9.—For a given area of cut with its associated cutting speed, the output of the tool acting on steels of various qualities is roughly inversely proportional to the tensile strength of the respective materials being machined.

10.—A tool working at a low speed with its associated area of cut will remove far more material under standard conditions in one hour than one which is working at a high speed with its associated area of cut.

11.—A tool with a long cutting edge has a longer life (under similar conditions of area of cut, cutting speed, and hardness of metal being machined) than one which has a short cutting edge.

The foregoing constitutes the data from the carbon steel tool tests; that relating to the high-speed steel tool tests will be found in our December 18 issue.

GAS FOR INDUSTRIAL PURPOSES.

ACCORDING to a paper on "Gas for Industrial Purposes," recently read by H. M. Thornton, before the British Commercial Gas Association, an engineer associated with the Indian Railways has introduced a new brazing material in connection with which the use of town gas is advocated. Heavy castings, such as large gear wheels and embossing presses, which have been fractured, have been successfully repaired with the new brazing material by the use of gas blow-pipes.

Etchings on Brass.

For etching on brass, a satisfactory ground, it is stated, can be made from equal parts of beeswax, Burgundy pitch, and asphaltum. These constituents are melted together and thoroughly stirred in order to secure a uniform mixture. This ground is warmed before using and spread evenly over the surface to be etched. When the ground has had time to cool, it is removed from the sections of the metal to be etched, after which the etching fluid is applied. A satisfactory etching fluid consists of one part of nitric acid to four parts of water. After the "biting" has been completed, which takes only a few minutes, the work is dipped in hot water to wash off the acid. The surface of the work can then be cleaned by wiping it with a cloth dipped in benzine or petrol.

Oil Fuel.

The use of oil fuel on a more extensive scale by the railways, steamships, and other large consumers in the Argentine, states the Railway Gazette, has hitherto been retarded owing to the uncertainty of local supply and the instability of price. The fact, however, that oil would be the most economical fuel is the general opinion among the State and private railway officials. The Government has not only been spending large sums in exploring for oil wells, but has been carrying out experiments with locomotives equipped for oil burning. The Buenos Aires Great Southern and Buenos Aires and Pacific Railways have also been similarly experimenting with remarkable success. Generally speaking, the results of the experiments have shown that the substitution of oil for coal would not only increase locomotive efficiency, but would effect substantial savings in the fuel bill. Basing the operating on the results obtained on the Mexican Railways, four barrels of oil, or about one-sixth of a metric ton, would do the same work as one metric ton of coal. Taking the price of oil at $7.00 and coal at $10.50, the proportion would be as 4½: 7.

The New Grey Iron Foundry of Sheldon's Ltd. Galt, Ont.

Staff Article

In our October issue we described the foundry layout and equipment of a large railroad rolling stock manufacturing corporation. In the present instance the nearly completed foundry of a widely known general engineering concern is featured, and it will be noted from a perusal of the details given that equal enterprise is shown in the latter, by the provision of an up-to-date building and modern accessory apparatus to secure the highest efficiency and maximum output.

A LARGE grey iron foundry has recently been completed by Sheldon's, Ltd., Galt, Ont. Fifteen years ago this Company built their first foundry as an adjunct to their general engineering business. The foundry staff at the initial stage consisted of two men, one of these being Mr. A. Oliver, the present foundry superintendent. Additions were made at various times to the old foundry, until the volume of business made it imperative that a new and more commodious foundry should be built. The result is a building of modern construction, as fireproof as is possible to make it, laid out on the most up-to-date lines, and equipped with the latest machinery. No expense has apparently been spared to achieve these ideals, and this should reflect favorably on the other departments, as grey iron castings enter very largely into the general products made by the Company. One of the many features that attracts the notice of the observer is the general brightness of the building, and which is a contrast to the gloom generally met with in this department, and this, together with the clean air conditions, will have a favorable effect on the employees, and, therefore, result in greater efficiency.

Construction Features.

The foundry is located on the north side of the Company's property, and lies parallel to the old foundry, and also to the machine shop, with the main power house 150 feet distant. The building is of fireproof construction, having steel frames and columns, with walls of hollow tile set in cement mortar and covered inside and outside with cement plaster. Windows extend the full length and breadth of the building, also in the monitor above the centre bay. ''Fenestra'' steel sash is used throughout, and ample ventilation is obtained by having sections of each set of windows made to open; the windows in the monitor connected up in sections of three, being opened mechanically by hand wheels, and those in the bays opened individually by hand. The roof is made of 2 inch matched boarding covered with Barrett roofing.

The foundry is 190 ft. long by 110 ft. wide, and is divided into three bays, the centre bay being 40 ft. wide, with a clearance height of 34 ft., and the side bays being 35 ft. wide, with a headroom of 170 ft. The floor of the centre or main bay is used entirely for moulding, while the south bay is divided into sections, the east end section containing the heating and air washing plant and cupola blower.

In the next section is the core room, with the core drying ovens just beyond. Then comes the cupola and charging floor; further on the brass furnaces, and at the extreme end of this bay are situated the tumblers. In the north bay are located the moulding machines, while the floor is used for making light castings. The foreman's office, 25 x 16 ft., is located at the eastern end of the north bay.

INTERIOR NEW GREY IRON FOUNDRY, WHEN NEARING COMPLETION, SHELDON'S, LTD., GALT, ONT.

INTERIOR OF FOUNDRY, CENTRE BAY.

Core Room and Ovens.

The core room and ovens occupy a space 48 x 35 ft. There are the usual facilities for making cores, and four ovens, 8 x 14 ft., 6 x 14 ft., and 4 x 14 ft., equipped with tracks, upon which run the trucks. The fourth is a drawer oven, and is 4 x 12 ft. The ovens are heated with individual coke stoves, and the gases are carried away by a chimney located outside the foundry.

The Cupola Feature.

There is at present one cupola in operation, this being 36 in. diameter inside, and having a capacity of 5 tons per hour. The Company built this cupola themselves, and have made provision for a larger one, which will be 46 in. diameter, and have a capacity of 10 tons per hour. The charging floor is 35 x 48 ft., and materials are carried up by means of an Otis Fensom electric hoist, 7 x 4 ft., having a capacity of 2,000 lbs., and operated by a 7½ h.p. 550 volt Can. General Electric motor. A Fairbanks scale is installed on the charging floor for weighing the different materials used in the cupola, while draft for the cupola is supplied by a blower unit, described later.

CLEANING ROOM AND TUMBLING MILLS.

Heating System.

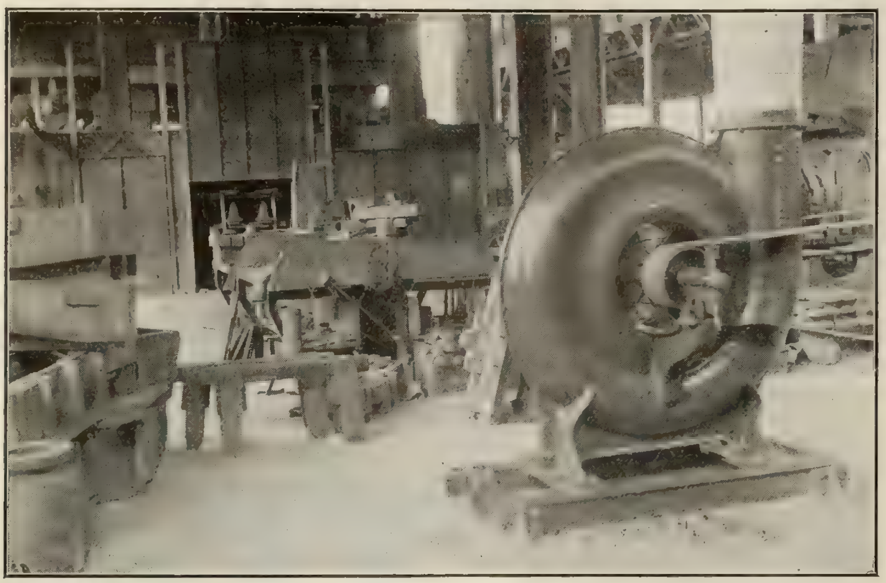
Provision has been made for a heating and air washing system. This plant will be located at the eastern end of the south bay, and will occupy a space 35 x 32 ft. The air washer, made by the Company, will have a capacity of 50,000 cubic feet, while the heating coils will be made of W.I. pipe. A No. 50 Keith fan, driven by a 25 h.p. Sheldon vertical, high speed, enclosed steam engine, is used in this connection. The air will be delivered through two concrete tunnels, one on each side of the main bay and extending the full length. Ducts made of galvanized iron will be connected with the tunnel at each column, each duct being fitted with a damper. In warm weather the coils will be filled with cold water, instead of steam as in the winter. By this system an even temperature will be maintained, and no heating coils will be necessary. In this section is situated a No. 9 Sheldon blower driven by a Sheldon 25 h.p. vertical high speed enclosed steam engine. This supplies air at 12 ozs. pressure to the cupola already described. Provision has been made for a duplicate set when the other cupola is installed. Above this section will be a wash room and lavatories and individual steel lockers made by the Company. A shower will also be fitted.

INTERIOR OF FOUNDRY, NORTH BAY.

Crane Equipment.

The present crane equipment includes a 15 ton "Northern" overhead traveller, made by the Northern Crane Works, Walkerville, Ont. This is electrically driven, and operates over the main bay.

It has three D.C. motors, 15, 10 and 5 h.p. respectively, which receive current at 220 volts from 50 a k.w. motor generator set situated in the main power plant. The motor generator is an A.C. machine, and is operated by Hydro-Electric power, and was supplied by the Can. Gen. Electric Co. Arrangements are being made by the Company to generate their own power. A 1 ton electric travelling crane will be installed in the core room and one of greater capacity in the north bay. A number of jib cranes will also be installed in the main bay.



CORE OVENS AND CUPOLA BLOWER.

Cleaning Room.

The equipment in the cleaning room at present consists of four rumblers, supplied by the W. W. Sly Mfg. Co., Cleveland, Ohio. These are 48 in. x 48 in. x 72 in. long, 24 in. x 44 in. x 48 in. long, 24 in. diam. x 48 in. long, and 18 in. diam. x 48 in. long respectively. There are also several grinders and a sand sifter, while provision has been made for a sand blast.

Moulding Machines.

In the north bay are six moulding machines. These consist of three roll-overs and one squeezer, supplied by the Tabor Mfg. Co., Philadelphia, Pa.; one roll-over and jarring machine, by the Davenport Machine & Foundry Co., Davenport, Iowa, and one roll-over and squeezer, by the Arcade Mfg. Co., Freeport, Ill. In addition to the above are two pulley molding machines, supplied by E. A. Delano Co., Chicago, Ill., one for moulding pulleys, 8 to 16 in. diam., and the other for pulleys from 17 in. to 30 in. diam. There is also one stripper by the Killen Mfg. Co.

Piping System.

A tunnel of reinforced concrete, 4 x 3 ft. x 150 ft. long, has been constructed between the boiler room and new foundry. Through this tunnel are taken the steam air and water pipes. The steam pipe is 6 in. diam., and supplies steam to the fan and blower engines. The air pipe is 4 in. diam., and conveys air from the compressor to the moulding machines and for general purposes. The water pipe is 2½ in. diam., and conveys water from a spring on the property for drinking and other purposes. The air and water pipes are carried overhead, and down at each column, where suitable connections are made. The air compressor is located in the main power house, and is a horizontal "Sheldon" machine, with a capacity of 150 cubic feet of free air per minute.

Lighting.

The centre bay has six 2,000 C.P. arc lamps working at 220 volts, and the side

EXTERIOR NEW GREY IRON FOUNDRY, SHELDON'S, LTD., GALT, ONT.

bays are each equipped with eleven 250 watt tungsten lamps at 110 volts. In addition to the above a number of 110 volt incandescent lamps will be installed for the various machines.

General Feature.

In the main power plant there is a 75 h.p. Wheelock engine, and, in the near future a 75 h.p. "Sheldon" vertical high speed engine driving a generator will be installed. Two 130 h.p. Goldie McCulloch return tubular boilers have been installed recently. When all the improvements to the power plant have been completed, the Company will be entirely independent of outside power.

CUPOLA AND CORE OVENS.

Mr. Oliver, the foundry superintendent, has under him at present about 60 men, but a much larger number will eventually be employed when all the equipment has been installed and when running at full capacity. There is at present practically a complete equipment, but provision has been made for duplicating a good deal of what already exists, with the exception of the heating plant, which will, of course, be in operation before the winter comes. There is ample room on the property for future extensions when they become necessary. The photographs show the foundry just before completion.

RECORDING MEMORANDA ON ACCIDENT PREVENTION.*

By Thomas D. West.

THERE are few occupations more hazardous and subject to accident through ignorance and error of judgment than the winning of metals from the earth and their conversion into articles of commerce. The risks incident to this, as well as every other activity, whether commercial, industrial, mining or the like, can often be greatly minimized or even averted altogether by conscientious effort on the part of the supervisors of the men engaged. The author has tried in the following paper to give an insight into this phase of the Accident Prevention situation. In fact, this forms one of the forty chapters of a forthcoming work he is publishing on "Developing Overseers and Managing Men and Work." Every person exercising a supervising influence upon men, while seeing that he receives a full day's work from them, should interest himself keenly in the prevention of accidents. Very little attention was paid to the subject six years ago, but owing to the recent universal agitation along this line, the present year, 1913, stands out as unexcelled in this respect.

Decreasing the Number.
